`__mark_id:n` A hidden marker is placed into every mark added by `\mark_insert:nn`. It will not show up in the output but its argument (a counter value that is incremented) makes all marks unique so the test for “equal” is not fooled by two different marks having the same mark text.

```

248 \cs_new_protected:Npn \__mark_id:n #1 { }

```

(End of definition for `__mark_id:n`.)

`\@kernel@before@insertmark` By default `\label`, `\index`, and `\glossary` do nothing when the mark is inserted.

`insertmark`

```

249 \int_new:N \g__mark_int
250 \cs_new:Npn \@kernel@before@insertmark {
251     \cs_set_eq:NN \label \scan_stop:
252     \cs_set_eq:NN \index \scan_stop:
253     \cs_set_eq:NN \glossary \scan_stop:

```

We count each mark and use that to place a hidden marker in front of the mark text. To ensure that there is no overflow (very unlikely but you never know) we restart every 100000 marks. Thus, if somebody puts more than that number of marks on a single page you could construct a scenario in which that approach fails.

```

254         \int_compare:nNnTF \g__mark_int < {99999}
255             { \int_gincr:N \g__mark_int }
256             { \int_gzero:N \g__mark_int }
257
258 }

```

The public hook to augment the setup.

```

259 \hook_new:n {insertmark}

```

(End of definition for \@kernel@before@insertmark and insertmark.)

`\mark_use_top:nn` To retrieve the first, last or top region mark, we grab the appropriate value stored in the corresponding token list variable and pass its contents back. These functions
`\mark_use_first:nn` should be used only in output routines and only after `__mark_update_structure_from_material:nn` has acted, otherwise their value will be wrong.
`\mark_use_last:nn`

If used with an unknown class or region they generate an error (fairly low-level because we are in an expandable context).

Each mark starts with an id and while the id does not print it is nevertheless better to remove it when returning the mark, so that downstream manipulation of the data doesn't have to deal with it.

```

260 \cs_new:Npn \mark_use_first:nn #1#2 { \__mark_use:v { g__mark_#1_first_#2_tl } }
261 \cs_new:Npn \mark_use_last:nn #1#2 { \__mark_use:v { g__mark_#1_last_#2_tl } }
262 \cs_new:Npn \mark_use_top:nn #1#2 { \__mark_use:v { g__mark_#1_top_#2_tl } }

```

This is what the `\use_none:nn` accomplishes.

```

263 \cs_new:Npn \__mark_use:n #1 { \exp_not:o { \use_none:nn #1 } }
264 \cs_generate_variant:Nn \__mark_use:n { v }

```

(End of definition for `\mark_use_top:nn`, `\mark_use_first:nn`, and `\mark_use_last:nn`. These functions are documented on page 897.)

7.4 Comparing mark values

`\mark_if_eq:nnnnTF` Test if in a given region (#1) for a given class (#2) the marks in position #3 and #4 (top, first, or last) are identical
`\mark_if_eq:nnnnnnTF`

```

265 \prg_new_conditional:Npnn \mark_if_eq:nnnn #1#2#3#4 { T , F , TF }
266 {
267     \tl_if_eq:ccTF { g__mark_ #1_#3_#2_tl }
268                   { g__mark_ #1_#4_#2_tl }
269     \prg_return_true:
270     \prg_return_false:
271 }

```

The fully general test (with two triplets of the form `<region>`, `<class>`, and `<position>`) is this:

```

272 \prg_new_conditional:Npnn \mark_if_eq:nnnnnn #1#2#3#4#5#6 { T , F , TF }
273 {
274     \tl_if_eq:ccTF { g__mark_ #1_#3_#2_tl }
275                   { g__mark_ #4_#6_#5_tl }
276     \prg_return_true:

```

```

277             \prg_return_false:
278         }

```

(End of definition for `\mark_if_eq:nnnnTF` and `\mark_if_eq:nnnnnTF`. These functions are documented on page 898.)

7.5 Messages

Mark errors are L^AT_EX kernel errors:

```

279 \prop_gput:Nnn \g_msg_module_type_prop { mark } { LaTeX }

302     \c__msg_return_text_tl
303   }

```

7.6 Debugging the mark structures

Code and commands in this section are not final, it needs more experimentation to see what kind of tracing information is going to be useful in practice. For now the tracing is mainly meant to be used for code testing and not so much for application testing.

It is quite likely that the commands and the behavior of the tracing might change in the future once we gained some experience with it.

```

\g__mark_debug_bool Holds the current debugging state.
304 \bool_new:N \g__mark_debug_bool
(End of definition for \g__mark_debug_bool.)

\mark_debug_on: Turns debugging on and off by redefining \__mark_debug:n.
\mark_debug_off: 305 \cs_new_eq:NN \__mark_debug:n \use_none:n
\__mark_debug:n 306 \cs_new_protected:Npn \mark_debug_on:
\__mark_debug_gset: 307 {

```

```

308     \bool_gset_true:N \g__mark_debug_bool
309     \__mark_debug_gset:
310   }
311 \cs_new_protected:Npn \mark_debug_off:
312   {
313     \bool_gset_false:N \g__mark_debug_bool
314     \__mark_debug_gset:
315   }
316 \cs_new_protected:Npn \__mark_debug_gset:
317   {
318     \cs_gset_protected:Npx \__mark_debug:n ##1
319     { \bool_if:NT \g__mark_debug_bool {##1} }
320   }

```

(End of definition for \mark_debug_on: and others. These functions are documented on page 899.)

\DebugMarksOn CamelCase commands for debugging.
\DebugMarksOff

```

321 \cs_new_eq:NN \DebugMarksOn   \mark_debug_on:
322 \cs_new_eq:NN \DebugMarksOff  \mark_debug_off:

```

(End of definition for \DebugMarksOn and \DebugMarksOff. These functions are documented on page 899.)

__mark_class_status:nn Shows the mark values across all regions for one mark class (#2). The first argument gives some *<info>* to help identifying where the command was called.

```

323 <*trace>
324 \cs_new_protected:Npn \__mark_class_status:nn #1#2

350       | \exp_not:v { g__mark_last-column_last_ #2 _t1 }   |}
351   }

```

(End of definition for `_mark_class_status:nn`.)

`_mark_status:n` Show a snapshot of all mark class values across all regions.

```
352 \cs_new_protected:Npn \_mark\_status:n #1
353   {
354     \seq_map_inline:Nn \g\_mark\_classes\_seq
355     { \_mark\_class\_status:nn {#1} {##1} }
356   }
357 </trace>
```

(End of definition for `_mark_status:n`.)

`\ShowMarksAt` Debugging helper that displays a snapshot of all known mark structures. The argument is a text string that is displayed to help identifying when the snapshot was made.

This may not stay like this (or at all), which is why it isn't yet documented as an official command.

```
358 \cs_new_protected:Npn \ShowMarksAt #1 {
359   <*trace>
360     \_mark\_debug:n { \_mark\_status:n {#1} }
361 </trace>
362 }
```

(End of definition for `\ShowMarksAt`.)

7.7 Designer-level interfaces

`\NewMarkClass` These two are identical to the L3 programming layer commands.

`\InsertMark`

```
363 \cs_new_eq:NN \NewMarkClass \mark\_new\_class:n
364 \@onlypreamble \NewMarkClass
365 \cs_new_eq:NN \InsertMark \mark\_insert:nn
```

(End of definition for `\NewMarkClass` and `\InsertMark`. These functions are documented on page 896.)

`\TopMark`

`\FirstMark`

`\LastMark`

The following commands take an optional argument that defaults to page. There is no checking that the region is actually valid. If not there is simply an empty return.

```
366 \NewExpandableDocumentCommand \FirstMark { 0{page} m }
367   { \mark\_use\_first:nn {#1}{#2} }
368 \NewExpandableDocumentCommand \LastMark { 0{page} m }
369   { \mark\_use\_last:nn {#1}{#2} }
370 \NewExpandableDocumentCommand \TopMark { 0{page} m }
371   { \mark\_use\_top:nn {#1}{#2} }
```

(End of definition for `\TopMark`, `\FirstMark`, and `\LastMark`. These functions are documented on page 897.)

`\IfMarksEqualTF`

We only provide a `CamelCase` command for the case with one region (optional) and one class. One could think of also providing a version for the general case with several optional arguments, but use cases for this are most likely rare, so not done yet.

```
372 \NewExpandableDocumentCommand \IfMarksEqualTF {0{page}mmm} {
373   \mark\_if\_eq:nnnnTF {#1}{#2}{#3}{#4}
374 }
```

(End of definition for `\IfMarksEqualTF`. This function is documented on page 898.)

8 L^AT_EX 2_ε integration

8.1 Core L^AT_EX 2_ε integration

`_mark_update_singlecol_structures:`

This command updates the mark structures if we are producing a single column document.

```
375 \cs_new_protected:Npn \_mark\_update\_singlecol\_structures: {
```

First we update the page region (which also updates the previous-page).

The `\@outputbox` is normally in `\vbox` in L^AT_EX but we can't take that for granted (an `amsmath` test document changed it to an `\hbox` just to trip me up) so we are a little careful with `unpack` now.

```
376   \box_if_vertical:NTF \@outputbox
377     {
378       \_mark\_update\_structure\_from\_material:nn {page}
379         { \vbox\_unpack:N \@outputbox }
380     }
381     {
382       \_mark\_update\_structure\_from\_material:nn {page}
383         { \hbox\_unpack:N \@outputbox }
384     }
```

Then we provide the necessary updates for the aliases.

```
385   \_mark\_update\_structure\_alias:nn {previous-column}{previous-page}
386   \_mark\_update\_structure\_alias:nn {column}{page}
387   \_mark\_update\_structure\_alias:nn {first-column}{page}
388   \_mark\_update\_structure\_alias:nn {last-column}{page}
389   <*trace>
390   % move this into status itself?
391   \_mark\_debug:n
392     {
393       \_mark\_status:n
394         { in~ OR~ (
395           \legacy\_if:nTF {@twoside}
396             { twoside-
397               \int\_if\_odd:nTF \c@page
398                 { odd }{ even }
399             }
400             { onside }
401           )
402         }
403     }
404   </trace>
405 }
```

(End of definition for `_mark_update_singlecol_structures:`.)

`_mark_update_dblcol_structures:`

This command handles the updates if we are doing two-column pages.

```
406 \cs_new_protected:Npn \_mark\_update\_dblcol\_structures: {
```

First we update the column and previous-column regions using the material assembled in `\@outputbox`.

```
407   \box_if_vertical:NTF \@outputbox
408     {
409       \_mark\_update\_structure\_from\_material:nn {column}
```

```

410     { \vbox_unpack:N \@outputbox }
411   }
412   {
413     \__mark_update_structure_from_material:nn {column}
414     { \hbox_unpack:N \@outputbox }
415   }

```

How we have to update the alias regions depends on whether or not `\@opcol` was called to process the first column or to produce the completed page

```

416   \legacy_if:nTF {@firstcolumn}
417     {

```

If we are processing the first column then `column` is our `first-column` and there is no `last-column` yet, so we make those an error.

```

418     \__mark_update_structure_alias:nn {first-column}{column}
419     \__mark_update_structure_to_err:n {last-column}
420   }
421   {

```

If we produce the completed page then the `first-column` is the same as the new `previous-column`. However, the structure should already be correct if you think about it (because it was set to `column` last time which is now the `previous-column`), thus there is no need to make an update.

```

422 %   \__mark_update_structure_alias:nn {first-column}{previous-column}

```

However, we now have a proper `last-column` so we assign that.

```

423   \__mark_update_structure_alias:nn {last-column}{column}

```

What now remains doing is to update the `page` and `previous-page` regions. For this we have to copy the settings in `page` into `previous-page` and then update `page` such that the top and first marks are taken from the `first-column` region and the last marks are taken from the `last-column` region. All this has to be done for all mark classes so we loop over our sequence.

Note that one loop is needed if we arrange the copy statements in a suitable way.

```

424   \seq_map_inline:Nn \g__mark_classes_seq
425     {

```

The `previous-page` updates need to come before the updates for `page` region because otherwise the values to copy are already overwritten. necessary values.

```

426     \tl_gset_eq:cc { g__mark_previous-page_top_  ##1 _tl }
427                 { g__mark_page_top_           ##1 _tl }
428     \tl_gset_eq:cc { g__mark_previous-page_first_ ##1 _tl }
429                 { g__mark_page_first_         ##1 _tl }
430     \tl_gset_eq:cc { g__mark_previous-page_last_  ##1 _tl }
431                 { g__mark_page_last_          ##1 _tl }

```

To update the `top` we only have to copy what is in `first-column`:

```

432     \tl_gset_eq:cc { g__mark_page_top_           ##1 _tl }
433                 { g__mark_first-column_top_     ##1 _tl }
434

```

Updating the `first` mark for the `page` region is more complicated. We first have to find out if there is any mark in the first column (this can be done by comparing the `top` and the `first` mark of that region).

```

435     \tl_if_eq:ccTF { g__mark_first-column_top_  ##1 _tl }
436                  { g__mark_first-column_first_ ##1 _tl }
437     {

```

If there is no mark in the first column we copy the first mark of the last column. If that doesn't contain a mark we still get the right result because the first mark is then equal to the top mark.

```

438         \tl_gset_eq:cc { g__mark_page_first_      ##1 _tl }
439                       { g__mark_last-column_first_ ##1 _tl }
440     }
441     {

```

On the other hand, if there is a mark in the first column we copy over the first mark from that column.

```

442         \tl_gset_eq:cc { g__mark_page_first_      ##1 _tl }
443                       { g__mark_first-column_first_ ##1 _tl }
444     }

```

The logic for the last page mark is again simple, we can just copy the value in the last mark of the last column. If that column doesn't contain any marks, then the value in last will be automatically the same as the last from the first column.

```

445         \tl_gset_eq:cc { g__mark_page_last_       ##1 _tl }
446                       { g__mark_last-column_last_ ##1 _tl }
447     }
448 }

8.2 Other L^AT_EX 2_ε output routines

This section will cover `multicol` and other packages altering or providing their own output routine. Not done yet.

8.3 Rollback information

```
473 <latexrelease>\IncludeInRelease{0000/00/00}{ltmarks}%  
474 <latexrelease>          {Undo-Marks-handling}  
475 <latexrelease>
```

We keep the interface commands around even if we roll back in case they are used in packages that don't roll back. Not likely to do a lot of good, but then there is not much we can do, but this at least they won't give unknown csname errors.

```
476 <latexrelease>\DeclareRobustCommand \NewMarkClass[1]{  
477 <latexrelease>\DeclareRobustCommand \InsertMark[2]{  
478 <latexrelease>\RenewExpandableDocumentCommand \FirstMark { 0{ } m } { }  
479 <latexrelease>\RenewExpandableDocumentCommand \LastMark { 0{ } m } { }  
480 <latexrelease>\RenewExpandableDocumentCommand \TopMark { 0{ } m } { }  
481 <latexrelease>\RenewExpandableDocumentCommand \IfMarksEqualTF { 0{ } mmm }{ }  
482 <latexrelease>
```

Same here, this avoided extra roll back code in the OR.

File 48

ltpage.dtx

1 Page styles and related commands

1.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

1.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

1.3 marking conventions

L^AT_EX extends T_EX's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T_EX's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T_EX's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the `pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 `<*2kernel>`

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}
```

(End of definition for `\pagestyle`.)

`\thispagestyle` User command to set the page style for this page only.

```
6 \def\thispagestyle#1{%
7   \ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}
```

(End of definition for \thispagestyle.)

`\ps@empty` The empty page style: No head or foot line.

```
10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}
```

(End of definition for \ps@empty.)

`\ps@plain` The plain page style: No head, centred page number in foot.

```
13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

(End of definition for \ps@plain.)

`\@leftmark` We implement `\@leftmark` and `\@rightmark` in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```
16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo
```

(End of definition for \@leftmark and \@rightmark.)

```
18 </2ekernel>
19 <*2ekernel | latexrelease>
20 <latexrelease>\IncludeInRelease{2022/06/01}%
21 <latexrelease>          {\markboth}{New mark support}%
```

`\markboth` User commands for setting L^AT_EX marks.

`\markright` Test for `\@nobreak` added 15 Apr 86 in `\markboth` and `\markright` letting `\label` and `\index` to `\relax` added 22 Feb 86 so these commands can appear in sectioning command arguments RmS 91/06/21 Same for `\glossary`

```
22 \ExplSyntaxOn
23 \DeclareRobustCommand*\markboth[2]{%
24   \begingroup
25   \let\label\relax \let\index\relax \let\glossary\relax
26   \unrestored@protected@xdef\@themark {{#1}{#2}}%
27   \@temptokena \expandafter{\@themark}%
```

In addition to generating the legacy mark we output the individual ones as well at the very same point. The legacy mark is kept unchanged in order to work with packages that expect that mark in exactly the way it is right now.

We might want to think about how to improve this in one-side documents, see comments below.

We have not changed all of the code to L³ prog layer convention, in case packages attempt to do some patching and expect the 2e names being around. Eventually this should and will change.

```
28   \mark_insert:nn{2e-left}{#1}
29   \mark_insert:nn{2e-right}{#2}
```

```

30   \tl_if_empty:nF{#2}{ \mark_insert:nn{2e-right-nonempty}{#2} }
31   \mark{the\@temptokena}%
32 \endgroup
33 \if@nobreak\ifvmode\nobreak\fi\fi}

34 \DeclareRobustCommand*\markright[1]{%
35 \begingroup
36 \let\label\relax \let\index\relax \let\glossary\relax

```

Protection is handled inside \@markright.

```

37 \expandafter\@markright\@themark {#1}%
38 \@temptokena \expandafter{\@themark}%

```

Same game with \markright more or less ...

```

39 \mark_insert:nn{2e-right}{#1}
40 \tl_if_empty:nF{#1}{ \mark_insert:nn{2e-right-nonempty}{#1} }

```

The legacy L^AT_EX mechanism always sets left and right mark, i.e., if a sub-mark (i.e., right mark) is set the corresponding main mark also is getting a mark with the same value it had previously. However, for the individual mark classes this means we are losing information so for them that is not done.

```

41 % \mark_insert:nn{2e-left}{\exp_after:wN \use_i:nn \@themark }
42 \mark{the\@temptokena}%
43 \endgroup
44 \if@nobreak\ifvmode\nobreak\fi\fi}
45 \ExplSyntaxOff

```

(End of definition for \markboth and \markright. These functions are documented on page 899.)

```

`\overfullrule` L^ATeX default is no overfull box rule. Changed by document class option.

```
98 \overfullrule Opt
```

(End of definition for \overfullrule.)

```
99 </2ekernel>
```

File 49

ltclass.dtx

1 Introduction

This file implements the following declarations, which replace `\documentstyle` in $\text{\LaTeX} 2_{\epsilon}$ documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between $\text{\LaTeX} 2_{\epsilon}$ and $\text{\LaTeX} 2.09$ is that $\text{\LaTeX} 2_{\epsilon}$ packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

2 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The *<main-option-list>* is a list of options which can modify the formatting of elements which are defined in the *<class>* file as well as in all following `\usepackage` declarations (see below). The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with $\text{\LaTeX} 2.09$ documents. It is similar to `\documentclass`, but it causes all options in *<main-option-list>* that the *<class>* does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in $\text{\LaTeX} 2.09$ compatibility mode. As far as most packages are concerned, this only affects the warnings and errors \LaTeX generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in *<package-list>* are called with the same options.

Each *<package>* file defines new elements (or modifies those defined in the *<class>*), and thus extends the range of documents which can be processed. The *<package-option-list>* is a list of options which can modify the formatting of elements defined in the *<package>* file. The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the $\langle package-option-list \rangle$, each package processes the $\langle main-option-list \rangle$. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents` (*env.*)

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of \TeX . Finally, you can use `noheader` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

2.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

3 Class and Package interface

3.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{<name>}[<version>]` command. The `<version>` should begin with a date in the format YYYY/MM/DD.

3.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{<name>}[<version>]` command. The `<version>` should begin with a date in the format YYYY/MM/DD.

3.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[<options>]{<name>}[<version>]`. If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{<options>}{<package>}`.

`\PassOptionsToClass` This adds the `<options>` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{<name>}[<version>]:`

This is similar to `\LoadClass`, but it always calls class `<name>` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`. `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

```
\IfPackageLoadedTF      To find out if a package has already been loaded, use
\IfClassLoadedTF       \IfPackageLoadedTF{<package>}{<true>}{<false>}
\@ifpackageloaded      \IfPackageLoadedTF{<package>}{<true>}{<false>}
\@ifclassloaded
```

or the old name `\@ifpackageloaded`.

```
\IfPackageAtLeastTF    To find out if a package has already been loaded with a version equal to or more
\IfClassAtLeastTF      recent than <date>, use
\IfFileAtLeastTF       \IfPackageAtLeastTF{<package>}{<date>}{<true>}{<false>}
\@ifpackagelater       \IfPackageAtLeastTF{<package>}{<date>}{<true>}{<false>}
\@ifclasslater         or the old name \@ifpackagelater.
\IfFormatAtLeastTF     To test the format date use
\IfFormatAtLeastTF{<date>}{<true>}{<false>}
```

```
\IfPackageLoadedWithOptionsTF  To find out if a package has already been loaded with at least the options <options>,
\IfClassLoadedWithOptionsTF use
\@ifpackagewith                 \IfPackageLoadedWithOptionsTF{<package>}{<options>}{<true>}{<false>}
\@ifclasswith
```

or the old name `\@ifpackagewith`.

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

3.4 Declaring new options

Options for classes and packages are built using the same macros.

```
\DeclareOption      To define a builtin option, use \DeclareOption{<name>}{<code>}.
\DeclareOption*     To define the default action to perform for local options which have not been declared,
use \DeclareOption*{<code>}.
```

Note: there should be no use of

```
\RequirePackage, \DeclareOption, \DeclareOption* or \ProcessOptions
inside \DeclareOption or \DeclareOption*.
```

Possible uses for `\DeclareOption*` include:

```
\DeclareOption*{}
```

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

```
\DeclareOption*{\@unkownoptionerror}
```

Complain about unknown local options. (The initial setting for package files.)

```
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}
```

Handle the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building

‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
  {}%
  {\OptionNotUsed}}
```

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

3.5 Safe Input Macros

```
\InputIfFileExists \InputIfFileExists{<file>}{<then>}{<else>}
Inputs <file> if it exists. Immediately before the input, <then> is executed. Otherwise
<else> is executed.
  \IfFileExists    As above, but does not input the file.
                   One thing you might like to put in the <else> clause is
\@missingfileerror This starts an interactive request for a filename, supplying default extensions. Just
hitting return causes the whole input to be skipped and entering x quits the current run,
  \input           This has been redefined from the LATEX 2.09 definition, in terms of the new commands
\InputIfFileExists and \@missingfileerror.
  \listfiles       Giving this declaration in the preamble causes a list of all files input via the ‘safe
input’ commands to be listed at the end. Any strings specified in the optional argument
to \ProvidesPackage are listed alongside the file name. So files in standard (and other
non-standard) distributions can put informative strings in this argument.
```

4 Implementation

```
1 <*2kernel>
\if@compatibility The flag for compatibility mode.
2 \newif\if@compatibility
(End of definition for \if@compatibility.)
\@documentclasshook This legacy hook is called after the first \documentclass command. It is not inte-
grated with the new 2020 hook management system! By default this checks to see if
\@normalsize is undefined, and if so, sets it to \normalsize.
3 \def\@documentclasshook{%
4   \ifx\@normalsize\@undefined
5     \let\@normalsize\normalsize
6   \fi
7 }
(End of definition for \@documentclasshook.)
\@declaredoptions This list is automatically built by \DeclareOption. It is the list of options (separated by
commas) declared in the class or package file and it defines the order in which the corre-
sponding \ds@<option> commands are executed. All local <option>s which are not de-
clared will be processed in the order defined by the optional argument of \documentclass
or \usepackage.
8 \let\@declaredoptions\@empty
```

(End of definition for \@declaredoptions.)

\@classoptionslist List of options of the main class.
9 \let\@classoptionslist\relax
10 %\@onlypreamble\@classoptionslist
(End of definition for \@classoptionslist.)

\@raw@classoptionslist List of options of the main class (unprocessed).
11 \let\@raw@classoptionslist\relax
(End of definition for \@raw@classoptionslist.)

\@unusedoptionlist List of options of the main class that haven't been declared or loaded as class option files.
12 \let\@unusedoptionlist\@empty
13 %\@onlypreamble\@unusedoptionlist
(End of definition for \@unusedoptionlist.)

\CurrentOption Name of current package or option.
14 \let\CurrentOption\@empty
(End of definition for \CurrentOption.)

\@currpath Path to the current file if explicitly given.
15 </2kernel>
16 <*2kernel | latexrelease>
17 <latexrelease>
18 <latexrelease>\IncludeInRelease{2020/10/01}{\@currpath}%
19 <latexrelease> {Add \@currpath}%
20 \let\@currpath\@empty
21 <latexrelease>\EndIncludeInRelease
22 %
23 <latexrelease>\IncludeInRelease{0000/00/00}{\@currpath}%
24 <latexrelease> {Add \@currpath}%
25 <latexrelease>\let\@currpath\@undefined
26 <latexrelease>\EndIncludeInRelease
27 </2kernel | latexrelease>
28 <*2kernel>
(End of definition for \@currpath.)

\@currname Name of current package or option.
29 \let\@currname\@empty
(End of definition for \@currname.)

\@current The current file extension.
30 \global\let\@current=\@empty
(End of definition for \@current.)

\@clsextension The two possible values of \@current.
\@pkgextension
31 \def\@clsextension{cls}
32 \def\@pkgextension{sty}

(End of definition for `\@clsextension` and `\@pkgextension`.)

```
\@pushfilename Commands to push and pop the file name and extension.
\@popfilename #1 current name.
\@currnamestack #2 current extension.
                #3 current catcode of @.
                #4 Rest of the stack.
33 </2ekernel>
34 <*2ekernel | latexrelease>
35 <latexrelease>
36 <latexrelease>\IncludeInRelease{2020/10/01}{\@pushfilename}%
37 <latexrelease> {Add \@expl@push@filename@@ and \@expl@push@filename@aux@@}%
38 \def\@pushfilename{%
```

The push and pop macros are injected in `\@pushfilename` and `\@popfilename` so that they correctly keep track of the hook labels.

This needs cleanup with the `expl3` interfaces also playing here, e.g., `\@expl@push@filename@@` needs cleanup and (and should probably not have this name either).

```
39 \@expl@push@filename@@
40 \xdef\@currnamestack{%
41   {\@currname}%
42   {\@currentext}%
43   {\the\catcode'\@}%
44   \@currnamestack}%
```

Temporarily add a stack for `\@currpath` here. This should be integrated in the main file stack eventually, but other packages rely on `\@currnamestack` having three elements per file, so that isn't a trivial change. The prefix `\@kernel@...` hopefully discourages people from using it.

```
45 \xdef\@kernel@currpathstack{%
46   {\@currpath}%
47   \@kernel@currpathstack}%
48 \@expl@push@filename@aux@@}
49 <latexrelease>\EndIncludeInRelease
```

The following version of `\@pushfilename` didn't formally exist in this file, but in the 2020/02/02 release, `expl3` was preloaded and it patched `\@pushfilename` (and `\@popfilename`) by adding some hooks in there. But rolling back to 2020/02/02, `expl3` doesn't patch these macros again, so rolling back has to take those hooks into account. Same goes for `\@popfilename`.

```
50 <latexrelease>
51 <latexrelease>\IncludeInRelease{2020/02/02}{\@pushfilename}%
52 <latexrelease> {Add \@expl@push@filename@@}%
53 <latexrelease>\def\@pushfilename{%
54 <latexrelease> \@expl@push@filename@@
55 <latexrelease> \xdef\@currnamestack{%
56 <latexrelease>   {\@currname}%
57 <latexrelease>   {\@currentext}%
58 <latexrelease>   {\the\catcode'\@}%

62 <latexrelease>
```

When we roll back from a release that has `expl3` preloaded, the definitions of `\@pushfilename` and `\@popfilename` can't be completely rolled back otherwise `expl3`-based packages won't have the automatic `\ExplSyntaxOff` at the end. Here and below for `\@popfilename`, we don't roll back all the way through if coming from `LATEX > 2020-02-02`.

```

```

(End of definition for \@pushfilename, \@popfilename, and \@currnamestack.)

`\@kernel@currpathstack` Path to the current file if explicitly given. The auxiliary is needed here to insert a `\@empty` to prevent the loss of braces.

```

123 </2ekernel>
124 <*2ekernel | latexrelease>
125 <latexrelease>
126 <latexrelease>\IncludeInRelease{2020/10/01}{\@kernel@currpathstack}%
127 <latexrelease> {Add \@kernel@currpathstack}%

```

If rolling backwards to this release, `\@kernel@currpathstack` will be defined, so the `\gdef` line should not be executed, thus the `\@gobblethree` will take it out, so the `sack` isn't touched.

```

128 <latexrelease>\@ifundefined{@kernel@currpathstack}{\@gobblethree}
129 \gdef\@kernel@currpathstack{}%

```

If rolling forward to this release, then the `\gdef` line above will define the path stack to be empty (which it can't be, inside a file), so the code below will traverse the `\@currnamestack`, and add as many empty items to `\@kernel@currpathstack` as there are items in `\@currnamestack`, so both are back in sync. Most of the time `latexrelease` is loaded on top-level, so only one item is needed, but `platexrelease` loads it internally, so the more complicated loop is needed.

\default@ds The default option code. Set by `\@onefilewithoptions` to either `\OptionNotUsed` for classes, or `\@unknownoptionerror` for packages. This may be reset in either case with `\DeclareOption*`.

```
534 % \let\default@ds\OptionNotUsed
```

(End of definition for \default@ds.)

\ProcessOptions `\ProcessOptions` calls `\ds@option` for each known package option, then calls `\default@ds` for each option on the local options list. Finally resets all the declared options to `\relax`. The empty option does nothing, this has to be reset on the off chance it's set to `\relax` if an empty element gets into the `\@declaredoptions` list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options.

If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

889 \@onlypreamble\@fileswith@pti@ns

```

This macro is used when loading packages or classes.

`\load@onefilewithoptions`

Have the main argument as #1, so we only need one `\expandafter` above.

```
890 </2kernel>
891 <*2kernel | latexrelease>
892 <latexrelease>\IncludeInRelease{2020/10/01}%
893 <latexrelease>      {\@onefilewithoptions}{Hooks and unused options issue}%
```

Here this macro is called `\@onefilewithoptions`, but further ahead in this file it is renamed to `\load@onefilewithoptions`, and `\@onefilewithoptions` becomes a wrapper around this, used for bookkeeping when rolling back. Therefore, when in `latexrelease`, we need to define `\load@onefilewithoptions` instead, thus the extra guarded `\def` line below:

```
894 <*2kernel>
895 \def\@onefilewithoptions#1[#2][#3]#4{%
896 </2kernel>
897 <latexrelease>\def\load@onefilewithoptions#1[#2][#3]#4{%
```

We have to sanitise file names, so that something like

```
\usepackage{some/local/path/array}
\usepackage{array}
```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use `\@expl@@@filehook@set@curr@file@@nNN` to parse the file name and return the `<path>` and `<base+ext>` in separate token lists. Further ahead, most operations use `\@currname` which doesn't have a path attached to it; only few actions prepend `\@currpath` to `\@currname` (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```
898 \@expl@@@filehook@set@curr@file@@nNN{#1.#4}\reserved@a\reserved@b
899 \edef\reserved@c{\def\noexpand\reserved@c###1%
900 \detokenize\expandafter{\expanded{.#4}}%
901 \noexpand\@nil{\def\noexpand\reserved@a{###1}}}\reserved@c
902 \expandafter\reserved@c\reserved@a\@nil
903 \@pushfilename
904 \xdef\@currname{\string@makeletter\reserved@a}%
905 \xdef\@currpath{\ifx\reserved@b\empty\else\reserved@b\fi}%
906 \global\let\@current#4%
```

The command `\ver@<file>.<ext>` is used to signal that a package is already loaded, either because it is in fact loaded, or because its loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with `\ver@<file>.<ext>`, so before checking if the file exists we have to check that we do need to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```
907 \@ifl@aded\@current\@currname
```

In the current preferred approach, a key family name will exist for processing using `ltkeys`. In that case, we replace the previous package options with the new ones, then call the key handler. Otherwise, we use the more classical clash handler.

```
908 {%
909 \@ifundefined{opt@handler@\@currname.\@current}
```

```

910     {\@onefilewithoptions@clashchk{#2}}
911     {%
912         \expandafter\protected@edef
913         \csname opt@\@currname.\@current\endcsname
914         {\zap@space#2 \@empty}%
915
916         \expandafter\def
917         \csname @raw@opt@\@currname.\@current\expandafter\endcsname
918         \expandafter{#2}%
919         \@nameuse{opt@handler@\@currname.\@current}%
920     }%
921     {\makeatletter

```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```

922     \@reset@ptions

```

First we take the `<name>` and `<ext>` given in the argument and check if the file exists, and issue an error otherwise asking for a correction with `\@missingfileerror`. For checking if the file exists we use `\@currpath` (usually empty) before `\@currname`.

```

923     \IfFileExists{\@currpath\@currname.\@current}{}%
924     {\@missing@onefilewithoptions{#2}}%

```

If `\@currname` is empty (the user replied to the “Enter file name” prompt with `<RETURN>`), so stop here (do `\@popfilename` to pop the item just added above).

This `\@gobble` omits the date check at the end.

```

925     \ifx\@currname\@empty
926     \expandafter\@gobble
927     \else

```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with `\@filehook@file@push` then call `\set@curr@file` to set `\@curr@file` (and do any required substitution), then actually load the class/package with `\load@onefile@withoptions`. `\set@curr@file` also needs the file path.

```

928     \@disable@packageload@do{\@currname.\@current}%
929     {\@expl@@@filehook@file@push@@
930     \set@curr@file{\@currpath\@currname.\@current}%
931     \@filehook@set@CurrentFile

```

The `\set@curr@file` line above might have replaced the file, so `\@currname` and `\@current` may no longer hold the actual package being loaded, so in that case we need to update these two token lists (`\@curr@file` holds the file name after replacement, so we parse that).

The requested file is saved in `\@currpkg@reqd` to be used in `\InputIfFileExists` later: if the updated `\@currname` and `\@current` are used we lose track of the substitution, so `\CurrentFile` and `\CurrentFileUsed` will be (incorrectly) the same.

```

932     \expandafter\@swaptwoargs\expandafter
933     {\expandafter{\@currpkg@reqd}}%
934     {% <

```

\@currpkg@reqd doesn't take a path because it is used later to assign \opt@... and \ver@....

```

935     \edef\@currpkg@reqd{\@currname.\@currentx}%
936     \ifx\CurrentFile\CurrentFileUsed
937     \else
938     \filename@parse\@curr@file
939     \edef\@currpath{\string@makeletter\filename@area}%
940     \edef\@currname{\string@makeletter\filename@base}%
941     \edef\@currentx{\string@makeletter\filename@ext}%
942     \fi
943     \load@onefile@withoptions{#2}%
944     \def\@currpkg@reqd%{\@currpkg@reqd}
945     }% >

```

Now just clean up and exit.

```

946     \expl@@@filehook@file@pop@@}%
947     \expandafter\@firstofone
948     \fi}%

```

Except in the case where \@currname is empty, the date is checked against the date marked in the package file:

```

949     {\@ifl@ter\@currentx{\@currname}{#3}-}%
950     {\@latex@warning@no@line
951     {You have requested,\on@line,
952     version\MessageBreak
953     '#3' of \@cls@pkg\space \@currname,\MessageBreak
954     but only version\MessageBreak
955     '\csname ver@\@currname.\@currentx\endcsname'\MessageBreak
956     is available}}%

957     \ifx\@currentx\@clsex@ension\let\LoadClass\@twoloadclasserror\fi}%
958     \@popfilename
959     \@reset@ptions}

```

If the package is already loaded, check that there were no option clashes.

```

960 \def\@onefilewithoptions@clashchk#1{%
\@onefilewithoptions@clashchk
961   \@if@ptions\@currentx{\@currname}{#1}-}%
962   {\@latex@error
963   {Option clash for \@cls@pkg\space \@currname}%
964   {The package \@currname\space has already been loaded
965   with options:\MessageBreak
966   \space\space[\@optionlist{\@currname.\@currentx}]\MessageBreak
967   There has now been an attempt to load it
968   with options\MessageBreak
969   \space\space[#1]\MessageBreak
970   Adding the global options:\MessageBreak
971   \space\space
972   \@optionlist{\@currname.\@currentx},#1\MessageBreak
973   to your \noexpand\documentclass declaration may fix this.%
974   \MessageBreak
975   Try typing \space <return> \space to proceed.}}%
976   \@firstofone}

977 \let\@currpkg@reqd\@empty

```

```
978 \@onlypreamble\@onefilewithoptions
```

```
    The kernel no longer uses \@unprocessedoptions
```

```
979 \let\@unprocessedoptions\@undefined
```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

```
980 \def\@missing@onefilewithoptions#1{%
981   \@missingfileerror{\@currpath\@currname}\@currentx
982   \global\let\@currpath\@missingfile@area
983   \global\let\@currname\@missingfile@base
984   \global\let\@currentx\@missingfile@ext}
```

Now the code that actually does the file loading:

```
\load@onefile@withoptions 985 \def\load@onefile@withoptions#1{%
986   \let\CurrentOption\@empty
987   \@reset@options
```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```
988   \def\reserved@a{%
989     \@pass@options\@currentx{#1}\@currname}%

990   \expandafter\let
991     \csname opt@\@currpkg@reqd\expandafter\endcsname
992     \csname opt@\@currname.\@currentx\endcsname
993   \expandafter\let
994     \csname @raw@opt@\@currpkg@reqd\expandafter\endcsname
995     \csname @raw@opt@\@currname.\@currentx\endcsname
996   \global\expandafter
997   \let\csname ver@\@currname.\@currentx\endcsname\@empty
```

We initialize `\dots-h@k` here and only if we load the file so that it remains undefined otherwise.

```
998   \expandafter\let\csname\@currname.\@currentx-h@k\endcsname\@empty
```

When the current extension is `\@pkgextension` we are loading a package otherwise, if it is `\@clsextension`, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```
999 %-----
1000   \ifx\@currentx\@pkgextension
1001     \UseHook{package/before}%
1002     \UseOneTimeHook{package/\@currname/before}%
1003   \else
1004     \ifx\@currentx\@clsextension
1005       \UseHook{class/before}%
1006       \UseOneTimeHook{class/\@currname/before}%
1007     \fi
1008   \fi
```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```
1009   \InputIfFileExists{\@currpath\@currpkg@reqd}{}%
1010   {\@latex@error
1011     {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
1012 %-----
```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```

1013   \expandafter\let\csname unprocessedoptions-\@currname.\@current\endcsname
1014           \@unprocessedoptions
1015   \csname\@currname.\@current-h@@k\endcsname
1016   \expandafter\let\csname\@currname.\@current-h@@k\endcsname
1017           \@undefined

```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```

1018   \ifx\@unprocessedoptions\relax
1019       \let\@unprocessedoptions\undefined

```

Otherwise run the per package set of unused options.

```

1020   \else
1021       \csname unprocessedoptions-\@currname.\@current\endcsname
1022   \fi

```

In either case we drop the macro afterwards as it is no longer needed.

```

1023   \expandafter\let
1024       \csname unprocessedoptions-\@currname.\@current\endcsname
1025       \@undefined

```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```

1026 %-----
1027   \ifx\@current\@pkgextension
1028       \UseOneTimeHook{package/\@currname/after}%
1029       \UseHook{package/after}%
1030   \else
1031       \ifx\@current\@clsextension
1032           \UseOneTimeHook{class/\@currname/after}%
1033           \UseHook{class/after}%
1034       \fi
1035   \fi}%
1036 %-----
1037   \@ifl@aded\@current\@currname{}{\reserved@a}

```

Now declare the non-generic package and class hooks used above:

```

1038 \NewHook{package/before}
1039 \NewHook{class/before}
1040 \NewReversedHook{package/after}
1041 \NewReversedHook{class/after}

1042 </2kernel | latexrelease>
1043 <latexrelease>\EndIncludeInRelease
1044 <latexrelease>\IncludeInRelease{0000/00/00}%
1045 <latexrelease>     {\@onefilewithoptions}{Hooks and unused options issue}%
1046 <latexrelease>

```

Because of the way `\@onfilewithoptions` is changed for rollback handling below we have to define `\load@onefilewithoptions` when rolling back!

```

1047 <latexrelease>\def\load@onefilewithoptions#1[#2][#3]#4{%

4.1 Hooks

Allow code to be saved to be executed at specific later times.

Here we save things in macros. I considered using toks registers (and `\addto@hook` from the NFSS code), but that would require stacking the contents in the case of required packages, so just generate a new macro for each package.

```

\@begindocumenthook Stuff to appear at the beginning or end of the document.

5 Package/class rollback mechanism

```

1563 </2ekernel)
1564 <*2ekernel | latexreleasefirst)

```

`\pkgcls@debug` For testing we have a few extra lines of code that by default do nothing but one can set `\pkgcls@debug` to `\typeout` to get extra info. Sometime in the future this will be dropped.

```

1565 <*tracerollback)
1566 %\let\pkgcls@debug\typeout
1567 \let\pkgcls@debug@gobble
1568 </tracerollback)

```

(End of definition for \pkgcls@debug.)

`\requestedLaTeXdate` The macro (!) `\requestedLaTeXdate` holds the globally requested rollback date (via `latexrelease`) or zero if no such request was made.

```

1569 \def\requestedLaTeXdate{0}

```

(End of definition for \requestedLaTeXdate.)

`\pkgcls@targetdate` If a rollback for a package or class is requested then `\pkgcls@targetdate` holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of `\requestedLaTeXdate`) and `\pkgcls@targetlabel` will be empty. If there was a request for a named version then `\pkgcls@targetlabel` holds the version name and `\pkgcls@targetdate` is set to 1.

`\pkgcls@targetdate=0` is used to indicate that there was no rollback request. While loading an old release `\pkgcls@targetdate` is also reset to zero so that `\DeclareRelease` declarations are bypassed.

In contrast `\pkgcls@innerdate` will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T_EX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```
1570 \ifx\pkgcls@targetdate\@undefined
1571 \newcount\pkgcls@targetdate
1572 \fi
1573 \let\pkgcls@targetlabel\@empty
1574 \def\pkgcls@innerdate{\maxdimen}
```

(End of definition for `\pkgcls@targetdate`, `\pkgcls@targetlabel`, and `\pkgcls@innerdate`.)

`\pkgcls@candidate` When looping through the `\DeclareRelease` declarations we record if the release is the best candidate we have seen so far. This is recorded in `\pkgcls@candidate` and we update it whenever we see a better one.

In `\pkgcls@releasedate` we keep track of the release date of that candidate.

```
1575 \let\pkgcls@candidate\@empty
1576 \let\pkgcls@releasedate\@empty
```

(End of definition for `\pkgcls@candidate` and `\pkgcls@releasedate`.)

`\load@onefilewithoptions` the best place to add the rollback code is at the point where `\@onefilewithoptions` is called to load a single class or package.

To make things easy we save the old definition as `\load@onefilewithoptions` and then provide a new interface.

Important: as this code is also unconditionally placed into latexrelease we can only do this name change once otherwise both macros will contain the same code.

```
1577 \ifx\load@onefilewithoptions\@undefined
1578 \let\load@onefilewithoptions\@onefilewithoptions
1579 \def\@onefilewithoptions#1[#2][#3]#4{%
```

First a bit of tracing normally disabled.

```
1580 {*tracerollback}
1581 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
1582 \pkgcls@debug{\@spaces 1: #1}%
1583 \pkgcls@debug{\@spaces 2: #2}%
1584 \pkgcls@debug{\@spaces 3: #3}%
1585 \pkgcls@debug{\@spaces 4: #4}%
1586 </tracerollback>
```

Two of the arguments are needed later on in error/warning messages so we save them.

```
1587 \def\pkgcls@name{#1}% % for info message
1588 \def\pkgcls@arg {#3}% % for info message
```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```
1589 \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```
1590 \let\pkgcls@candidate\@empty
```

If we had a rollback request then #3 may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```
1591 \begingroup
1592 \edef\reserved@a{%
1593   \endgroup
1594   \unexpanded{\load@onefilewithoptions#1[#2]}%
1595   [\pkgcls@mindate]%
1596   \unexpanded{#4}}%
1597 \reserved@a
1598 }
1599 \fi
```

(End of definition for `\load@onefilewithoptions` and `\@onefilewithoptions`.)

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn't start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	<code>\pkgcls@targetdate</code>	<code>\pkgcls@targetlabel</code>	<code>\pkgcls@mindate</code>
<code><empty></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><empty></code>
<code><date></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><date></code>
<code>=<date></code>	<code><date-as-number></code>	<code><empty></code>	<code><empty></code>
<code>=<version></code>	1	<code><version></code>	<code><empty></code>
<code><other></code>	<code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><other></code>

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn't one 0.

```
1600 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```

1601 \ifx\@nil#1\@nil
1602   \pkgcls@targetdate\requestedLaTeXdate\relax
1603   \let\pkgcls@targetlabel\@empty
1604   \let\pkgcls@mindate\@empty

```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```

1605 \else
1606   \pkgcls@parse@date@arg@#1=\@nil\relax
1607 \fi
1608 }

```

The actual parsing work then happens in `\pkgcls@parse@date@arg@`:

```

1609 \def\pkgcls@parse@date@arg@#1=#2\@nil{%

```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```

1610 \pkgcls@targetdate

```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```

1611 \ifx\@nil#1\@nil
1612   \@parse@version0#2//00\@nil\relax

```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```

1613   \ifnum \pkgcls@targetdate=\z@
1614     \pkgcls@targetdate\@ne
1615     \def\pkgcls@innerdate{\maxdimen}%
1616     \pkgcls@parse@date@arg@version#2%
1617   \else
1618     \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1619   \fi
1620   \let\pkgcls@mindate\@empty
1621 \else

```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of `\pkgcls@targetdate`):

```

1622   \requestedLaTeXdate\relax
1623   \let\pkgcls@targetlabel\@empty
1624   \def\pkgcls@innerdate{\maxdimen}%
1625   \def\pkgcls@mindate{#1}%

```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```

1626     \ifnum \pkgcls@targetdate > \z@
1627     \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1628     \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
1629     A minimal date of #1 has been specified for
1630     \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
1631     But this is in conflict
1632     with a rollback request to \requestedpatchdate}
1633     \fi
1634     \fi
1635     \fi
1636 }

```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```

1637 \def\pkgcls@parse@date@arg@version#1={%
1638   \def\pkgcls@targetlabel{#1}}

```

(End of definition for \pkgcls@parse@date@arg.)

\DeclareRelease First argument is the “name” of the release and it can be left empty if one doesn’t like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be `<pkg/cls-name>-<date>.<extension>` but this is not enforced and through this argument one can overwrite it.

```

1639 \def\DeclareRelease#1#2#3{%
1640   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1641   <*tracerollback>
1642     \pkgcls@debug{---\string\DeclareRelease:}%
1643     \pkgcls@debug{\@spaces 1: #1}%
1644     \pkgcls@debug{\@spaces 2: #2}%
1645     \pkgcls@debug{\@spaces 3: #3}%
1646   </tracerollback>

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

1647     \ifx\@nil#2\@nil
1648     \ifnum\pkgcls@targetdate=\@ne % named request
1649     \def\reserved@a{#1}%
1650     \ifx\pkgcls@targetlabel\reserved@a
1651     \pkgcls@use@this@release{#3}{}%
1652   <*tracerollback>
1653     \else
1654     \pkgcls@debug{Label doesn't match}%
1655   </tracerollback>
1656     \fi
1657   <*tracerollback>
1658     \else
1659     \pkgcls@debug{Date request: ignored}%
1660   </tracerollback>
1661     \fi
1662   \else

```

If the value of `\pkgcls@targetdate` is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```
1663 \ifnum\pkgcls@targetdate>\@ne % a real request
```

So we parse the date of this release to check if it is before or after the request date.

```
1664 \ifnum\@parse@version#2//00\@nil
1665 >\pkgcls@targetdate
```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date when a package used didn't yet exist). So we make a complaint to the user.

```
1666 \ifx\pkgcls@candidate\@empty
1667 \pkgcls@rollbackdate@error{#2}%
1668 \pkgcls@use@this@release{#3}{#2}%
1669 \else
1670 \pkgcls@use@this@release\pkgcls@candidate
1671 \pkgcls@releasedate
1672 \fi
1673 \else
```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```
1674 \def\pkgcls@candidate{#3}%
1675 \def\pkgcls@releasedate{#2}%
1676 (*tracrollback)
1677 \pkgcls@debug{New candidate: #3}%
1678 </tracrollback)
1679 \fi
1680 \else
```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```
1681 \def\reserved@a{#1}%
1682 \ifx\pkgcls@targetlabel\reserved@a
1683 \pkgcls@use@this@release{#3}{#2}%
1684 (*tracrollback)
1685 \else
1686 \pkgcls@debug{Label doesn't match}%
1687 </tracrollback)
1688 \fi
1689 \fi
1690 \fi
1691 \fi
1692 }
```

(End of definition for `\DeclareRelease`.)

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
1693 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
1694 \pkgcls@show@selection{#1}{#2}%
```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed⁴⁷ and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `\@@input!`

```
1695 \pkgcls@targetdate\z@
1696 \@@input #1\relax
1697 \endinput
1698 }
```

(End of definition for \pkgcls@use@this@release.)

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```
1699 \def\pkgcls@show@selection#1#2{%
1700 <*tracerollback>
1701 \pkgcls@debug{Result: use #1}%
1702 </tracerollback>
1703 \GenericInfo
1704 {\@spaces\@spaces\space}{Rollback for
1705 \@cls@pkg\space'\@currname' requested ->
1706 \ifnum\pkgcls@targetdate>\@ne
1707 date
1708 \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1709 \requestedpatchdate
1710 \else
1711 \expandafter\@gobble\pkgcls@arg
1712 \fi.\MessageBreak
```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```
1713 Best approximation is
1714 \else
1715 version '\pkgcls@targetlabel'.\MessageBreak
1716 This corresponds to
1717 \fi
1718 \ifx\@nil#2\@nil
1719 a special release%
1720 \else
1721 the release introduced on #2%
1722 \fi
1723 \@gobble}%
1724 }
```

⁴⁷The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

(End of definition for `\pkgcls@show@selection`.)

`\pkgcls@rollbackdate@error` This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case happens only once so it is inlined.

```
1725 \def\pkgcls@rollbackdate@error#1{%
1726   \@latex@error{Suspicious rollback date given}%
1727   {The \@cls@pkg\space'\@currname' has no rollback data
1728     before #1 which\MessageBreak
1729     is after your requested rollback date --- so
1730     something may be wrong here.\MessageBreak
1731     Continue and we use the earliest known release.}}
```

(End of definition for `\pkgcls@rollbackdate@error`.)

`\DeclareCurrentRelease` This declares the date (and possible name) of the current version of a package or class.

```
1732 \def\DeclareCurrentRelease#1#2{%
```

First we test if `\pkgcls@targetdate` is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```
1733   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1734   {*tracerollback}
1735   \pkgcls@debug{---DeclareCurrentRelease}%
1736   \pkgcls@debug{ 1: #1}%
1737   \pkgcls@debug{ 2: #2}%
1738   </tracerollback}
```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with `\pkgcls@targetdate`.

```
1739   \ifnum\pkgcls@targetdate>\@ne % a date request
1740   \ifnum\@parse@version#2//00\@nil
1741     >\pkgcls@targetdate
```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a `\DeclareCurrentRelease` but no declared older releases (so basically the use of the declaration is a bit dubious).

```
1742   \ifx\pkgcls@candidate\@empty
1743   \pkgcls@rollbackdate@error{#2}%
1744   \else
1745   \pkgcls@use@this@release\pkgcls@candidate
1746   \pkgcls@releasedate
1747   \fi
```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```
1748   \else
1749   \pkgcls@show@selection{current version}{#2}%
1750   \fi
1751   \else % a label request
```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1752     \def\reserved@a{#1}%
1753     \ifx\pkgcls@targetlabel\reserved@a
1754         \pkgcls@show@selection{current version}{#2}%
1755     \else
1756         \@latex@error{Requested version '\pkgcls@targetlabel' for
1757             \@cls@pkg\space'\@currname' is unknown}\@ehc
1758     \fi
1759 \fi
1760 \fi
1761 }

```

(End of definition for `\DeclareCurrentRelease`.)

`\IfTargetDateBefore` This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1762 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1763     \ifnum\pkgcls@innerdate <%
1764         \expandafter\@parse@version\expandafter0#1//00\@nil
1765         \typeout{Exclude code introduced on #1}%
1766         \expandafter\@firstoftwo
1767     \else
1768         \typeout{Include code introduced on #1}%
1769         \expandafter\@secondoftwo
1770     \fi
1771 }

```

(End of definition for `\IfTargetDateBefore`.)

```

1772 </2ekernel | latexreleasefirst)

```

6 After Preamble

Finally we declare a package that allows all the commands declared above to be `\@onlypreamble` to be used after `\begin{document}`.

```

1773 <{*afterpreamble)
1774 \NeedsTeXFormat{LaTeX2e}
1775 \ProvidesPackage{pkgindoc}
1776     [2020-08-08 v1.3m Package Interface in Document (DPC)]
1777 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
1778     \gdef\@preamblecmds{#1#3}}
1779 \expandafter\reserved@a\@preamblecmds\relax
1780 </afterpreamble)

```

File 50

ltkeys.dtx

1 Creating and using keyval options

As with any key–value input, using key–value pairs as package or class options has two parts: creating the key options and setting (using) them. Options created in this way *may* be used after package loading as general key–value settings: this will depend on the nature of the underlying code.

`\DeclareKeys` `\DeclareKeys [family] {declarations}`

Creates a series of options from a comma-separated *declarations* list. Each entry in this list is a key–value pair, with the *key* having one or more *properties*. A small number of “basic” *properties* are described below. The full range of properties, provided by `l3keys`, can also be used for more powerful processing. See `interface3` for the full details.

The basic properties provided here are

- `.code` — execute arbitrary code
- `.if` — sets a TeX `\if...` switch
- `.ifnot` — sets an inverted TeX `\if...` switch
- `.store` — stores a value in a macro
- `.usage` — defines whether the option can be given only when loading (`load`), in the preamble (`preamble`) or has no limitation on scope (`general`)

The part of the *key* before the *property* is the *name*, with the *value* working with the *property* to define the behaviour of the option.

For example, with

```
\DeclareKeys [mypkg]
{
  draft.if          = @mypkg@draft      ,
  draft.usage      = preamble          ,
  name.store       = \@mypkg@name      ,
  name.usage       = load              ,
  second-name.store = \@mypkg@other@name
}
```

three options would be create. The option `draft` can be given anywhere in the preamble, and will set a switch called `\if@mypkg@draft`. The option `name` can only be given during package loading, and will save whatever value it is given in `\@mypkg@name`. Finally, the option `second-name` can be given anywhere, and will save its value in `\@mypkg@other@name`.

Keys created *before* the use of `\ProcessKeyOptions` act as package options.

`\DeclareUnknownKeyHandler` `\DeclareUnknownKeyHandler [family] {code}`

The function `\DeclareUnknownKeyHandler` may be used to define the behavior when an undefined key is encountered. The `{code}` will receive the unknown key name as `#1` and the value as `#2`. These can then be processed as appropriate, e.g. by forwarding to another package.

`\ProcessKeyOptions` `\ProcessKeyOptions [family]`

The `\ProcessKeyOptions` function is used to check the current option list against the keys defined for `{family}`. Global (class) options and local (package) options are checked when this function is called in a package.

`\SetKeys` `\SetKeys [family] {keyvals}`

Sets (applies) the explicit list of `{keyvals}` for the `{family}`: if the latter is not given, the value of `\currname` is used. This command may be used within a package to set options before or after using `\ProcessKeyOptions`.

1.1 Implementation of `ltkeys`

```
1 <@@=keys>
2 <*2kernel>
3 \ExplSyntaxOn
```

1.2 Key properties

```
.code
.if 4 \group_begin:
.ifnot 5 \cs_set_protected:Npn \__keys_tmp:nn #1#2
.store 6 {
.usage 7 \quark_if_recursion_tail_stop:n {#1}
8 \cs_new_eq:cc
9 { \c__keys_props_root_str . #2 }
10 { \c__keys_props_root_str . #1 }
11 \__keys_tmp:nn
12 }
13 \__keys_tmp:nn
14 { code:n } { code }
15 { legacy_if_set:n } { if }
16 { legacy_if_set_inverse:n } { ifnot }
17 { tl_set:N } { store }
18 { usage:n } { usage }
19 { \q_recursion_tail } { }
20 \q_recursion_stop
21 \group_end:
```

(End of definition for .code and others.)

1.3 Main mechanism

```
22 \cs_generate_variant:Nn \clist_put_right:Nn { Nv }
```

`\l__keys_options_clist` A single list is used for all options, into which they are collected before processing.

```
23 \clist_new:N \l__keys_options_clist
```

(End of definition for \l_keys_options_clist.)

\l_keys_options_loading_bool

Used to indicate we are in the loading phase: controls the outcome of warnings.

```
24 \bool_new:N \l_keys_options_loading_bool
```

`__keys_options:n` The main function calls functions to collect up the global and local options into `\l_keys_options_clist` before calling the underlying functions to actually do the processing. So that a suitable message is produced if the option is unknown, the special `unknown` key is set if it does not already exist for the current family, and is cleaned up afterwards if required. To allow the L^AT_EX 2_ε layer to know this mechanism is active, and to deal with the key family not matching the file name, we store the family in all cases.

```
25 \cs_new_protected:Npn \__keys_options:n #1
26   { \__keys_options_expand_module:Nn \__keys_options_aux:n {#1} }
27 \cs_new_protected:Npn \__keys_options_aux:n #1
28   {
29     \cs_gset_protected:cpn { opt@handler@\currname.\@currxt }
30     { \ProcessKeyOptions [ #1 ] }
31     \cs_set_protected:Npn \__keys_option_end: { }
32     \clist_clear:N \l_keys_options_clist
33     \__keys_options_global:n {#1}
34     \__keys_options_local:
35     \keys_if_exist:nnF {#1} { unknown }
36     {
37       \keys_define:nn {#1}
38       {
39         unknown .code:n =
40         {
41           \msg_error:nxxx { keys } { option-unknown }
42           { \l_keys_key_str } { \@currname }
43         }
44       }
45     \cs_set_protected:Npn \__keys_option_end:
46     { \keys_define:nn {#1} { unknown .undefine: } }
47   }
48   \bool_set_true:N \l_keys_options_loading_bool
49   \clist_map_variable:NNn \l_keys_options_clist \CurrentOption
50   { \keys_set:nV {#1} \CurrentOption }
51   \bool_set_false:N \l_keys_options_loading_bool
52   \AtEndOfPackage { \cs_set_eq:NN \@unprocessedoptions \scan_stop: }
53   \__keys_option_end:
54   \__keys_options_loaded:n {#1}
55 }

56 \msg_new:nnnn { keys } { option-unknown }
57 { Unknown~option~'#1'~for~package~#2. }
58 {
59   LaTeX~has~been~asked~to~set~an~option~called~'#1'~
60   but~the~package~"\msg_module_name:n {#2}"~has~not~created~an~option~with~this~name.
61 }
```

(End of definition for `__keys_options:n`, `__keys_options_aux:n`, and `__keys_options_end:`)

`__keys_options_global:n` Global (class) options are handled differently for L^AT_EX 2_ε packages and classes. Hence this function is essentially a check on the current file type. The initial test is needed as L^AT_EX 2_ε allows variables to be equal to `\scan_stop:`, which is usually forbidden in expl3 code.

```

62 \cs_new_protected:Npn \__keys_options_global:n #1
63   {
64     \cs_if_eq:NNF \@raw@classoptionslist \scan_stop:
65     {
66       \cs_if_eq:NNTF \@currentt \clsextension
67       { \__keys_options_class:n {#1} }
68       { \__keys_options_package:n {#1} }
69     }
70   }

```

(End of definition for `__keys_options_global:n`.)

`__keys_options_class:n` For classes, each option (stripped of any content after =) is checked for existence as a key. If found, the option is added to the combined list for processing. On the other hand, unused options are stored up in `\@unusedoptionlist`. Before any of that, though, there is a simple check to see if there is an unknown key. If there is, then *everything* will match and the mapping can be skipped.

```

71 \cs_new_protected:Npn \__keys_options_class:n #1
72   {
73     \cs_if_free:cF { @raw@opt@ \@currname . \@currentt }
74     {
75       \keys_if_exist:nnTF {#1} { unknown }
76       {
77         \clist_put_right:Nv \l__keys_options_clist
78         { @raw@opt@ \@currname . \@currentt }
79       }
80       {
81         \clist_map_inline:cn { @raw@opt@ \@currname . \@currentt }
82         {
83           \exp_args:Ne \__keys_options_class:nnn
84           { \tl_trim_spaces:e { \__keys_remove_equals:n {##1} } }
85           {##1} {#1}
86         }
87       }
88     }
89   }
90 \cs_new_protected:Npn \__keys_options_class:nnn #1#2#3
91   {
92     \keys_if_exist:nnTF {#3} {#1}
93     {
94       \clist_put_right:Nn \l__keys_options_clist {#2}
95       \clist_remove_all:Nn \@unusedoptionlist {#1}
96     }
97     {
98       \clist_if_in:NnF \@unusedoptionlist {#1}
99       { \clist_put_right:Nn \@unusedoptionlist {#1} }
100    }
101  }

```

(End of definition for `__keys_options_class:n` and `__keys_options_class:nnn`.)

`_keys_options_package:n` For global options when processing a package, the tasks are slightly different from those
`_keys_options_package:nnn` for a class. The check is the same, but here there is nothing to do if the option is not applicable. Each valid option also needs to be removed from `\@unusedoptionlist`.

```

102 \cs_new_protected:Npn \_keys_options_package:n #1
103   {
104     \clist_map_inline:Nn \@raw@classoptionslist
105       {
106         \exp_args:Ne \_keys_options_package:nnn
107           { \tl_trim_spaces:e { \_keys_remove_equals:n {##1} } }
108           {##1} {#1}
109       }
110   }
111 \cs_new_protected:Npn \_keys_options_package:nnn #1#2#3
112   {
113     \keys_if_exist:nnT {#3} {#1}
114     {
115       \clist_put_right:Nn \l_keys_options_clist {#2}
116       \clist_remove_all:Nn \@unusedoptionlist {#1}
117     }
118   }

```

(End of definition for `_keys_options_package:n` and `_keys_options_package:nnn`.)

`_keys_options_local:` If local options are found, they are added to the processing list. L^AT_EX 2_ε stores options for each file in a macro which may or may not exist, hence the need to use `\cs_if_exist:c`.

```

119 \cs_new_protected:Npn \_keys_options_local:
120   {
121     \cs_if_eq:NNF \@current \@clsextension
122     {
123       \cs_if_exist:cT { @raw@opt@ \@currname . \@current }
124       {
125         \clist_put_right:Nv \l_keys_options_clist
126           { @raw@opt@ \@currname . \@current }
127       }
128     }
129   }

```

(End of definition for `_keys_options_local:`.)

`_keys_remove_equals:n` As the name suggests, this is a simple function to remove an equals sign from the input.
`_keys_remove_equals:w` This is all wrapped up in an n function so that there will always be a sign available.

```

130 \cs_new:Npn \_keys_remove_equals:n #1
131   { \_keys_remove_equals:w #1 = \s_keys_stop }
132 \cs_new:Npn \_keys_remove_equals:w #1 = #2 \s_keys_stop { \exp_not:n {#1} }

```

(End of definition for `_keys_remove_equals:n` and `_keys_remove_equals:w`.)

1.4 The document interfaces

```

133 \cs_generate_variant:Nn \keys_define:nn { nx }

```

`_keys_options_expand_module:Nn` To deal with active characters inside the module argument whilst also expanding that
`_keys_options_expand_module:nN` argument, we use a combination of c- and f-type expansion. This works as the definitions for active UTF-8 bytes contain an `\ifincsname` test.

```

134 \cs_new_protected:Npn \__keys_options_expand_module:Nn #1#2
135   {
136   \cs:w __keys_options_expand_module:nN \use:e { \cs_end: {#2} } #1
137   }
138 \cs_new_protected:Npn \__keys_options_expand_module:nN #1#2
139   { #2 {#1} }

```

(End of definition for `__keys_options_expand_module:Nn` and `__keys_options_expand_module:nN`.)

\DeclareKeys Defining key options is quite straight-forward: we have an intermediate function to allow for potential set-up steps.

```

140 \NewDocumentCommand \DeclareKeys { 0 { \@currname } +m }
141   { \__keys_options_expand_module:Nn \keys_define:nn {#1} {#2} }

```

(End of definition for `\DeclareKeys`. This function is documented on page 979.)

\DeclareUnknownKeyHandler

```

142 \NewDocumentCommand \DeclareUnknownKeyHandler { 0 { \@currname } +m }
143   {
144   \cs_set_protected:cpn { __keys_unknown_handler_ #1 :nn } ##1##2 {#2}
145   \__keys_options_expand_module:Nn \keys_define:nx {#1}
146   {
147     unknown .code:n =
148       \exp_not:N \exp_args:NV
149         \exp_not:c { __keys_unknown_handler_ #1 :nn }
150         \exp_not:N \l_keys_key_str {###1}
151   }
152   }

```

(End of definition for `\DeclareUnknownKeyHandler`. This function is documented on page 980.)

\ProcessKeyOptions We need to deal with the older interface from `l3keys2e` here: it had a mandatory argument. We can mop that up using a look-ahead, and then exploit that information to determine whether the package option handling is set up for the new approach for clash handling.

```

153 \NewDocumentCommand \ProcessKeyOptions { 0 { \@currname } }
154   { \__keys_options:n {#1} }
155 \@onlypreamble \ProcessKeyOptions

```

(End of definition for `\ProcessKeyOptions`. This function is documented on page 980.)

1.5 Option usage scope

`__keys_options_loaded:n` Indicates that the load-time options for a package have been processed: once this has happened, make them unavailable either with a warning or an error.

```

156 \cs_new_protected:Npn \__keys_options_loaded:n #1
157   {
158   \prop_get:NnNT \l_keys_usage_load_prop {#1} \l__keys_tmpa_tl
159   {
160     \clist_map_inline:Nn \l__keys_tmpa_tl
161     {
162       \keys_define:nn {#1}
163       {
164         ##1 .code:n =
165         \__keys_options_loaded:nn {#1} {##1}

```

```

166         }
167     }
168 }
169 }
170 \cs_new_protected:Npn \__keys_options_loaded:nn #1#2
171 {
172     \bool_if:NTF \l__keys_options_loading_bool
173     { \msg_warning:nnnn { keys } { load-option-ignored } }
174     { \msg_error:nnnn { keys } { load-only } }
175     {#1} {#2}
176 }
177 \msg_new:nnn { keys } { load-option-ignored }
178 {
179     Package~"\msg_module_name:n {#1}"~has~already~been~loaded:~
180     ignoring~load~time~option~"#2".
181 }
182 \msg_new:nnnn { keys } { load-only }
183 {
184     Key~"#2"~may~only~be~used~during~loading~of~package~
185     "\msg_module_name:n {#1}".
186 }
187 {
188     LaTeX~was~asked~to~set~a~key~called~"#2",~but~this~is~only~allowed~
189     in~the~optional~argument~when~loading~package~"\msg_module_name:n {#1}".
190 }

```

(End of definition for __keys_options_loaded:n and __keys_options_loaded:nn.)

Disable all preamble options in one shot.

```

191 \tl_gput_left:Nn \@kernel@after@begindocument
192 {
193     \prop_map_inline:Nn \l_keys_usage_preamble_prop
194     {
195         \clist_map_inline:nn {#2}
196         {
197             \keys_define:nn {#1}
198             {
199                 ##1 .code:n =
200                 \msg_error:nnn { keys } { preamble-only } {##1}
201             }
202         }
203     }
204 }
205 \msg_new:nnnn { keys } { preamble-only }
206 { Key~"#1"~may~only~be~used~in~the~preamble. }
207 {
208     LaTeX~was~asked~to~set~a~key~called~"#1",~but~this~is~only~allowed~
209     before~\begin{document}.~You~will~need~to~set~the~key~earlier.
210 }

```

1.6 General key setting

\SetKeys A simple wrapper.

```
211 \NewDocumentCommand \SetKeys { 0 { \@currname } +m }
212   { \_keys_options_expand_module:Nn \keys_set:nn {#1} {#2} }

(End of definition for \SetKeys. This function is documented on page 980.)

213 \ExplSyntaxOff
214 </2kernel>
```

File 51

lfilehook.dtx

1 Introduction

1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\@input` or `\openin`.

<code>file/before</code>	These are:
<code>file/.../before</code>	
<code>file/.../after</code>	file/before, file/⟨file-name⟩/before These hooks are executed in that order just
<code>file/after</code>	before the file is loaded for reading. The code of the first hook is used with every file,

while the second is executed only for the file with matching `⟨file-name⟩` allowing you to specify code that only applies to one file.

file/⟨file-name⟩/after, file/after These hooks are after the file with name `⟨file-name⟩` has been fully consumed. The order is swapped (the specific one comes first) so that the `/before` and `/after` hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both `/before` and `/after` hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L^AT_EX is:

```
\UseHook{⟨file/before⟩}
\UseHook{⟨file/⟨file name⟩/before⟩}
  ⟨file contents⟩
\UseHook{⟨file/⟨file name⟩/after⟩}
\UseHook{⟨file/after⟩}
```

The file hooks only refer to the file by its name and extension, so the `⟨file name⟩` should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook `⟨file name⟩`, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that \TeX prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the $\langle file\ name \rangle$ is available in `\CurrentFile`, which is then used when accessing the `file/\langle file\ name \rangle/before` and `file/\langle file\ name \rangle/after`.

`\CurrentFile` The name of the file about to be read (or just finished) is available to the hooks through `\CurrentFile` (there is no `expl3` name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, `\input{sample}` and `\input{app/sample.tex}` would both have `\CurrentFile` being `sample.tex`.

`\CurrentFilePath` The path to the current file (complement to `\CurrentFile`) is available in `\CurrentFilePath` if needed. The paths returned in `\CurrentFilePath` are only user paths, given through `\input@path` (or `expl3`'s equivalent `\l_file_search_path_seq`) or by directly typing in the path in the `\input` command or equivalent. Files located by `kpsewhich` get the path added internally by the \TeX implementation, so at the macro level it looks as if the file were in the current folder, so the path in `\CurrentFilePath` is empty in these cases (package and class files, mostly).

`\CurrentFileUsed`
`\CurrentFilePathUsed` In normal circumstances these are identical to `\CurrentFile` and `\CurrentFilePath`. They will differ when a file substitution has occurred for `\CurrentFile`. In that case, `\CurrentFileUsed` and `\CurrentFilePathUsed` will hold the actual file name and path loaded by \LaTeX , while `\CurrentFile` and `\CurrentFilePath` will hold the names that were *asked for*. Unless doing very specific work on the file being read, `\CurrentFile` and `\CurrentFilePath` should be enough.

1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/array.sty/after` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

<code>package/before</code>	These are:
<code>package/after</code>	
<code>package/.../before</code>	<code>package/before</code>, <code>package/after</code> These hooks are called for each package being loaded.
<code>package/.../after</code>	
<code>class/before</code>	<code>package/\langle name \rangle/before</code>, <code>package/\langle name \rangle/after</code> These hooks are additionally called if the package name is $\langle name \rangle$ (without extension).
<code>class/after</code>	
<code>class/.../before</code>	<code>class/before</code>, <code>class/after</code> These hooks are called for each class being loaded.
<code>class/.../after</code>	
	<code>class/\langle name \rangle/before</code>, <code>class/\langle name \rangle/after</code> These hooks are additionally called if the class name is $\langle name \rangle$ (without extension).

All `/after` hooks are implemented as reversed hooks. The overall sequence of execution for `\usepackage` and friends is therefore:

```

\UseHook{<package/before>}
\UseHook{<package/<package name>/before>}
  \UseHook{<file/before>}
  \UseHook{<file/<package name>.sty/before>}
  <package contents>
  \UseHook{<file/<package name>.sty/after>}
  \UseHook{<file/after>}
  code from \AtEndOfPackage if used inside the package
\UseHook{<package/<package name>/after>}
\UseHook{<package/after>}

```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded (or it was loaded before the hooks were set) none of the hooks are executed!

All class or package hooks involving the name of the class or package are implemented as one-time hooks, whereas all other such hooks are normal hooks. This allows for the following use case

```

\AddToHook{package/varioref/after}
{ ... apply my customizations if the package gets
  loaded (or was loaded already) ... }

```

without the need to first test if the package is already loaded.

1.4 Hooks for `\include` files

To manage `\include` files, \LaTeX issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.⁴⁸ None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if \LaTeX makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is “No file `<filename>.tex`”).

⁴⁸If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

<code>include/before</code>	These are:
<code>include/.../before</code>	
<code>include/end</code>	include/before, include/<name>/before These hooks are executed (in that order) after the initial <code>\clearpage</code> and after <code>.aux</code> file is changed to use <code><name>.aux</code> , but
<code>include/.../end</code>	before the <code><name>.tex</code> file is loaded. In other words they are executed at the very
<code>include/after</code>	beginning of the first page of the <code>\include</code> file.
<code>include/.../after</code>	

include/<name>/end, include/end These hooks are executed (in that order) after \LaTeX has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

include/<name>/after, include/after These hooks are executed (in that order) after \LaTeX has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.⁴⁹

include/excluded, include/<name>/excluded The above hooks for `\include` files are only executed when the file is loaded (or more exactly the load is attempted). If, however, the `\include` file is explicitly excluded (through an `\includeonly` statement) the above hooks are bypassed and instead the `include/excluded` hook followed by the `include/<name>/excluded` hook are executed. This happens after \LaTeX has loaded the `.aux` file for this include file, i.e., after \LaTeX has updated its counters to pretend that the file was seen.

All `include` hooks involving the name of the included file are implemented as one-time hooks (whereas all other such hooks are normal hooks).

If you want to execute code that is run for every `\include` regardless of whether or not it is excluded, use the `cmd/include/before` or `cmd/include/after` hooks.

1.5 High-level interfaces for \LaTeX

We do not provide any additional wrappers around the hooks (like `filehook` or `scrfile` do) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

⁴⁹For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

1.6 Kernel, class, and package interfaces for L^AT_EX

<code>\declare@file@substitution</code>	<code>\declare@file@substitution</code>	<code>{\file}</code>	<code>{\replacement-file}</code>
<code>\undeclare@file@substitution</code>	<code>\undeclare@file@substitution</code>	<code>{\file}</code>	

If `\file` is requested for loading replace it with `\replacement-file`. `\CurrentFile` remains pointing to `\file` but `\CurrentFileUsed` will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of L^AT_EX kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases. As such it is mainly meant for use in the L^AT_EX kernel but other use cases are conceivable.

The `\undeclare@file@substitution` declaration undoes a substitution made earlier.

Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!

<code>\disable@package@load</code>	<code>\disable@package@load</code>	<code>{\package}</code>	<code>{\alternate-code}</code>
<code>\reenable@package@load</code>	<code>\reenable@package@load</code>	<code>{\package}</code>	

If `\package` is requested, do not load it but instead run `\alternate-code` which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files and again it should only be applied if there are good reasons for doing this.⁵⁰

1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
```

⁵⁰Just to be sure: "I don't like this package by somebody else" is not a good one :-)

```

= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) otllmr.fd
== (LEVEL 2 STOP) otllmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) tsllmr.fd
== (LEVEL 2 STOP) tsllmr.fd
== (LEVEL 2 START) tllmss.fd
== (LEVEL 2 STOP) tllmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx

```

Thus if you inspect an issue in the `.log` it is easy to figure out in which file it occurred, simply by searching back for `LEVEL` and if it is a `STOP` then remove 1 from the level value and search further for `LEVEL` with that value which should then be the `START` level of the file you are in.

2 The Implementation

```

1 <*2kernel>
2 <@@=filehook>

```

2.1 Document and package-level commands

`\CurrentFile` User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested `\input`).
`\CurrentFilePath` The versions `\...Used` hold the *actual* file name and path that is loaded by `LATEX`, whereas the other two hold the name as requested. They will differ in case there's a file substitution.
`\CurrentFileUsed`
`\CurrentFilePathUsed`

```

3 </2kernel>
4 <*2kernel | latexrelease>
5 <latexrelease>\IncludeInRelease{2020/10/01}%
6 <latexrelease>          {\CurrentFile}{Hook management file}%

8 \tl_new:N \CurrentFile
9 \tl_new:N \CurrentFilePath
10 \tl_new:N \CurrentFileUsed
11 \tl_new:N \CurrentFilePathUsed

```

```

12 \ExplSyntaxOff
13 </2ekernel | latexrelease>
14 <latexrelease>\EndIncludeInRelease

15 <latexrelease>\IncludeInRelease{0000/00/00}%
16 <latexrelease>          {\CurrentFile}{Hook management file}%
17 <latexrelease>
18 <latexrelease>\let \CurrentFile          \@undefined
19 <latexrelease>\let \CurrentFilePath      \@undefined
20 <latexrelease>\let \CurrentFileUsed     \@undefined
21 <latexrelease>\let \CurrentFilePathUsed \@undefined
22 <latexrelease>
23 <latexrelease>\EndIncludeInRelease
24 <*2ekernel>

```

(End of definition for \CurrentFile and others. These functions are documented on page 988.)

2.2 expl3 helpers

```

25 </2ekernel>
26 <*2ekernel | latexrelease>
27 <latexrelease>\IncludeInRelease{2020/10/01}%
28 <latexrelease>          {\_filehook_file_parse_full_name:nN}{File helpers}%
29 \ExplSyntaxOn

```

_filehook_file_parse_full_name:nN
_filehook_full_name:nn

A utility macro to trigger expl3’s file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn’t exist, no normalization takes place. The output of _filehook_file_parse_full_name:nN is passed on to the #2—a 3-argument macro that takes the *<path>*, *<base>*, and *<ext>* parts of the file name.

```

30 \cs_new:Npn \_filehook_file_parse_full_name:nN #1
31   {
32   \exp_args:Nf \file_parse_full_name_apply:nN
33     {
34     \exp_args:Nf \_filehook_full_name:nn
35       { \file_full_name:n {#1} } {#1}
36     }
37   }
38 \cs_new:Npn \_filehook_full_name:nn #1 #2
39   {
40   \tl_if_empty:nTF {#1}
41     { \tl_trim_spaces:n {#2} }
42     { \tl_trim_spaces:n {#1} }
43   }

```

(End of definition for _filehook_file_parse_full_name:nN and _filehook_full_name:nn.)

_filehook_if_no_extension:nTF
_filehook_drop_extension:N

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use _filehook_file_parse_full_name:nN to split up the file name and either check if *<ext>* (#3) is empty, or discard it.

```

44 \cs_new:Npn \_filehook_if_no_extension:nTF #1
45   {
46   \exp_args:Ne \tl_if_empty:nTF
47     { \file_parse_full_name_apply:nN {#1} \use_iii:nnn }
48   }

```

```

2.3 Declaring the file-related hooks

These hooks have names with three-parts that start with `file/`, `include/`, `class/` or `package/` and end with `/before` or `/after` (or `/end` in the case of `include/`). They are all generic hooks so will be declared only if code is added to them; this declaration is done for you automatically and, indeed, they should not be declared explicitly.

Those named `.../after` and `include/.../end` are, when code is added, declared as reversed hooks.

2.4 Patching L^AT_EX's `\InputIfFileExists` command

Most of what we have to do is adding `\UseHook` into several L^AT_EX 2_ε core commands, because of some circular dependencies in the kernel we do this only now and not in `ltxfiles`.

```
\InputIfFileExists \InputIfFileExists loads any file if it is available so we have to add the hooks
\@input@file@exists@with@hooks file/before and file/after in the right places. If the file doesn't exist no hooks
\unqu@tefilef@und should be executed.
```

```
143 </2kernel>
144 <latexrelease>\IncludeInRelease{2020/10/01}%
145 <latexrelease>      {\InputIfFileExists}{Hook management (files)}%
146 <*2kernel | latexrelease>

147 \let\InputIfFileExists\@undefined
148 \DeclareRobustCommand \InputIfFileExists[2]{%
149   \IfFileExists{#1}%
150   {%
151     \@expl@@@filehook@file@push@@
152     \@filehook@set@CurrentFile
```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don't change their value meanwhile. This isn't a worry with `\CurrentFile...` because they are kept in a stack.

```
153   \expandafter\@swaptwoargs\expandafter
154     {\expandafter\@input@file@exists@with@hooks
155       \expandafter{\@filef@und}}%
156     {#2}%
157   \@expl@@@filehook@file@pop@@
158 }%
159 }
160 \def\@input@file@exists@with@hooks#1{%
```

If the file exists then `\CurrentFile` holds its name. But we can't rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/.../after` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`expl3`'s `\file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension

are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

161 \edef\reserved@a{%
162   \@expl@@@filehook@file@pop@assign@@nnnn
163   {\CurrentFilePathUsed}%
164   {\CurrentFileUsed}%
165   {\CurrentFilePath}%
166   {\CurrentFile}}%
167 \expandafter\@swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\@clsextension
...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\@clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a T_EX string like `\jobname`) will have these character tokens incorrectly turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in T_EX Live didn't bring up any obvious candidate for breaking with this catcode change).

```

168 {\edef\reserved@a{\unqu@tefilef@und#1\@nil}%
169  \@addtofilelist{\string@makeletter\reserved@a}%
170  \UseHook{file/before}%

```

The current file name is available in `\CurrentFile` so we use that in the specific hook.

```

171  \UseHook{file/\CurrentFile/before}%
172  \@input #1% <- trailing space comes from \@filef@und
173  }%

```

And here, `\CurrentFile` is restored (by `\@expl@@@filehook@file@pop@assign@@nnnn`) so we can use it once more.

```

174  \UseHook{file/\CurrentFile/after}%
175  \UseHook{file/after}}
176 \def\unqu@tefilef@und"#1" \@nil{#1}

```

Now declare the non-generic file hooks used above:

```

177 \NewHook{file/before}
178 \NewReversedHook{file/after}
179 <latexrelease>\EndIncludeInRelease
180 </2ekernel | latexrelease>

```

Now define `\InputIfFileExists` to input #1 if it seems to exist. Immediately prior to the input, #2 is executed. If the file #1 does not exist, execute '#3'.

```

181 <latexrelease>\IncludeInRelease{2019/10/01}%
182 <latexrelease>      {\InputIfFileExists}{Hook management (files)}%
183 <latexrelease>
184 <latexrelease>\DeclareRobustCommand \InputIfFileExists[2]{%
185 <latexrelease>  \IfFileExists{#1}%
186 <latexrelease>   {%

```

187 <latexrelease> \expandafter\@swaptwoargs\expandafter
188 <latexrelease>      {\@filef@und}{#2\@addtofilelist{#1}\@input}}
189 <latexrelease>\let\@input@file@exists@with@hooks\@undefined
190 <latexrelease>\let\unqu@tefilef@und\@undefined
191 <latexrelease>\EndIncludeInRelease

192 <latexrelease>\IncludeInRelease{0000/00/00}%
193 <latexrelease>      {\InputIfFileExists}{Hook management (files)}%
194 <latexrelease>\long\def \InputIfFileExists#1#2{%
195 <latexrelease>  \IfFileExists{#1}%
196 <latexrelease>    {#2\@addtofilelist{#1}\@input \@filef@und}}

```

Also undo the internal command as some packages unfortunately test for their existence instead of using `\IfFormatAtLeastTF`.

```

197 <latexrelease>\expandafter\let\csname InputIfFileExists \endcsname\@undefined

198 <latexrelease>\let\@input@file@exists@with@hooks\@undefined
199 <latexrelease>\let\unqu@tefilef@und\@undefined
200 <latexrelease>\EndIncludeInRelease
201 <*2ekernel>

```

(End of definition for `\InputIfFileExists`, `\@input@file@exists@with@hooks`, and `\unqu@tefilef@und`.)

2.5 Declaring a file substitution

```

202 <@=filehook>
203 </2ekernel>
204 <*2ekernel | latexrelease>
205 <latexrelease>\IncludeInRelease{2020/10/01}%
206 <latexrelease>      {\_filehook_subst_add:nn}{Declaring file substitution}%
207 \ExplSyntaxOn

```

`_filehook_subst_add:nn` `_filehook_subst_add:nn` declares a file substitution by doing a (global) definition of the form `\def\@file-subst@{file}{replacement}`. The file names are properly sanitised, and normalized with the same treatment done for the file hooks. That is, a file replacement is declared by using the file name (and extension, if any) only, and the file path should not be given. If a file name is empty it is replaced by `.tex` (the empty `csname` is used to check that).

```

208 \cs_new_protected:Npn \_filehook_subst_add:nn #1 #2
209   {
210   \group_begin:
211     \cs_set:cpx { } { \exp_not:o { \cs:w\cs_end: } }

```

265 <@@= >

```

2.6 Selecting a file (`\set@curr@file`)

```

\set@curr@file Now we hook into \set@curr@file to resolve a possible file substitution, and add
\set@curr@file@nosearch \@expl@@@filehook@set@curr@file@@nNN at the end, after \@curr@file is set.

```

```

\curr@file A file name is built using \expandafter\string\csname<filename>\endcsname to
\curr@file@reqd avoid expanding utf8 active characters. The \csname expands the normalization machinery
and the routine to resolve a file substitution, returning a control sequence with the
same name as the file.

```

It happens that when `<filename>` is empty, the generated control sequence is `\csname\endcsname`, and doing `\string` on that results in the file `csnameendcsname.tex`. To guard against that we `\ifx`-compare the generated control sequence with the empty `csname`. To do so, `\csname\endcsname` has to be defined, otherwise it would be equal to `\relax` and we would have false positives. Here we define `\csname\endcsname` to expand to itself to avoid it matching the definition of some other control sequence.

```

282   \edef~{\string~}%
283   \expandafter\def\csname\expandafter\endcsname
284     \expandafter{\csname\endcsname}%

```

Two file names are set here: `\@curr@file@reqd` which is the file requested by the user, and `\@curr@file` which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. `\@curr@file` is resolved first, to check if a substitution happens. If it doesn't, `\@expl@@@filehook@if@file@replaced@@TF` short-cuts and just copies `\@curr@file`, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default `.tex` is *not* added to `\@curr@file` because for applications other than `\input` (graphics, for example) the default extension may not be `.tex`. First check if the input has an extension, then if the input had no extension, call

\@expl@@@filehook@drop@extension@@N. In case of a file substitution, \@curr@file will have an extension.

2.7 Replacing a file and detecting loops

`_filehook_resolve_file_subst:w` Start by sanitizing the file with `__filehook_file_parse_full_name:nN` then do `__filehook_file_subst_begin:nnn{<path>}{<name>}{<ext>}`.
`_filehook_normalize_file_name:w`
`_filehook_file_name_compose:nnn`

```

406 </2ekernel>
407 <*2ekernel | latexrelease>
408 <latexrelease>\IncludeInRelease{2020/10/01}%
409 <latexrelease> \\_filehook_resolve_file_subst:w}{Replace files detect loops}%
410 \ExplSyntaxOn

```

```

411 \cs_new:Npn \__filehook_resolve_file_subst:w #1 \@nil
412 { \__filehook_file_parse_full_name:nN {#1} \__filehook_file_subst_begin:nnn }
413 \cs_new:Npn \__filehook_normalize_file_name:w #1 \@nil
414 { \__filehook_file_parse_full_name:nN {#1} \__filehook_file_name_compose:nnn }
415 \cs_new:Npn \__filehook_file_name_compose:nnn #1 #2 #3
416 { \tl_if_empty:nF {#1} { #1 / } #2#3 }

```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\set@curr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `__filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `__filehook_if_file_replaced:TF` will wrongly return true.

```

417 \flag_new:n { __filehook_file_replaced }
418 \cs_new:Npn \__filehook_if_file_replaced:TF #1 #2
419 { \flag_if_raised:nTF { __filehook_file_replaced } {#1} {#2} }
420 \cs_new_protected:Npn \__filehook_clear_replacement_flag:
421 { \flag_clear:n { __filehook_file_replaced } }

```

First off, start by checking if the current file (`\langle name \rangle + \langle ext \rangle`) has a declared substitution. If not, then just put that as the name (including a possible `\langle path \rangle` in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `__filehook_file_subst_tortoise_hare:nn` sees that there's no replacement for `#2#3` and does nothing else.

```

422 \cs_new:Npn \__filehook_file_subst_begin:nnn #1 #2 #3
423 {
424   \__filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }
425   { \__filehook_file_name_compose:nnn {#1} {#2} {#3} }
426 }
427 \ExplSyntaxOff
428 </2ekernel | latexrelease>
429 <latexrelease>\EndIncludeInRelease
430 <*2ekernel>

```

2.7.1 The Tortoise and Hare algorithm

If there is a substitution (`\langle true \rangle` in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag __filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put `TEX` in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `__filehook_file_subst_loop:cc` is called with `\@file-subst@<file>` and `\@file-subst@\@file-subst@<file>`; that is, the substitution of `\langle file \rangle` and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within `__filehook_file_subst_loop:NN` the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop, `__filehook_file_subst_tortoise_hare:nn` is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the `\cs_if_exist:cTF` below will go `<false>` and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

431 </2kernel>
432 <*2kernel|latexrelease>
433 <latexrelease>\IncludeInRelease{2020/10/01}%
434 <latexrelease> {\__filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
435 \ExplSyntaxOn
436 \cs_new:Npn \__filehook_file_subst_tortoise_hare:nn #1 #2 #3
437 {
438   \cs_if_exist:cTF { @file-subst@ #2 }
439   {
440     \flag_if_raised:nF { __filehook_file_replaced }
441     { \flag_raise:n { __filehook_file_replaced } }
442     \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
443     {
444       \__filehook_file_subst_loop:cc
445       { @file-subst@ #1 }
446       { @file-subst@ \use:c { @file-subst@ #2 } }
447     }
448     { \use:c { @file-subst@ #2 } }
449   }
450   { #3 }
451 }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the `.tex` file is used as fallback and `__filehook_file_subst_cycle_error:cN` is called to report the error.

```

452 \cs_new:Npn \__filehook_file_subst_loop:NN #1 #2
453 {
454   \token_if_eq_meaning:NNTF #1 #2
455   {
456     .tex
457     \__filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
458   }
459   { \__filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
460 }
461 \cs_generate_variant:Nn \__filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

462 \cs_new:Npn \__filehook_file_subst_cycle_error:NN #1 #2
463 {
464   \msg_expandable_error:nmff { latex2e } { file-cycle }
465   {#1} { \use:c { @file-subst@ #1 } }
466   \token_if_eq_meaning:NNTF #1 #2

```

```

467     { \_filehook\_file\_subst\_cycle\_error:cN { @file-subst@ #1 } #2 }
468   }
469 \cs_generate_variant:Nn \_filehook\_file\_subst\_cycle\_error:NN { c }
    And the error message:
470 \msg_new:nnn { latex2e } { file-cycle }
471   { File~loop!~#1~replaced~by~#2... }

(End of definition for \_filehook\_resolve\_file\_subst:w and others.)

2.9 High-level interfaces for L^AT_EX

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L^AT_EX_{2 ϵ} names to allow for internal commands to be used outside this module (and in parts that still use L^AT_EX_{2 ϵ} syntax. We have to unset the @@ since we want double “at” sign in place of double underscores.

```

3 A sample package for structuring the log output

```

539 <*structuredlog>
540 <@@=filehook>

541 \ProvidesExplPackage
542   {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
543   {Structuring the TeX transcript file}

```

`\g_filehook_nesting_level_int` Stores the current package nesting level.

```
544 \int_new:N \g_filehook_nesting_level_int
```

Initialise the counter with the number of files in the `\@currnamestack` (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

```

545 \int_gset:Nn \g_filehook_nesting_level_int
546   { ( \tl_count:N \@currnamestack ) / 3 - 1 }

```

(End of definition for `\g_filehook_nesting_level_int`.)

`_filehook_log_file_record:n` This macro is responsible for increasing and decreasing the file nesting level, as well as printing to the log. The argument is either `STOPTART` or `STOP` and the action it takes on the nesting integer depends on that.

```

547 \cs_new_protected:Npn \_filehook_log_file_record:n #1
548   {
549     \str_if_eq:nnT {#1} {START} { \int_gincr:N \g_filehook_nesting_level_int }
550     \iow_term:x
551     {
552       \prg_replicate:nn { \g_filehook_nesting_level_int } { = } ~
553       ( LEVEL ~ \int_use:N \g_filehook_nesting_level_int \c_space_tl #1 ) ~
554       \CurrentFileUsed

```

If there was a file replacement, show that as well:

```

555       \str_if_eq:NNF \CurrentFileUsed \CurrentFile
556       { ~ ( \CurrentFile \c_space_tl requested ) }
557       \iow_newline:
558     }
559   \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g_filehook_nesting_level_int }
560 }

```

Now just hook the macro above in the generic `file/before...`

```
561 \AddToHook{file/before}{ \_filehook_log_file_record:n { START } }
```

... and `file/after` hooks. We don't want to install the `file/after` hook immediately, because that would mean it is the first time executed when the package finishes. We therefore put the declaration inside `\AddToHookNext` so that it gets only installed when we have left this package.

```
562 \AddToHookNext{file/after}
```

```
563   { \AddToHook{file/after}{ \_filehook_log_file_record:n { STOP } } }
```

(End of definition for `_filehook_log_file_record:n`.)

```
564 <@@=>
```

```
565 </structuredlog>
```

4 Package emulations

4.1 Package `atveryend` emulation

With the new hook management and the hooks in `\enddocument` all of `atveryend` is taken care of. We can make an emulation only here after the substitution functionality is available:

```
566 <*2kernel>
```

```
567 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
```

```
568 </2kernel>
```

Here is the package file we point to:

```
569 <*atveryend-ltx>
```

```
570 \ProvidesPackage{atveryend-ltx}
```

```
571   [2020/08/19 v1.0a
```

```
572   Emulation of the original atveryend package^^Jwith kernel methods]
```

Here are new definitions for its interfaces now pointing to the hooks in `\enddocument`

```
573 \newcommand\AfterLastShipout  {\AddToHook{enddocument/afterlastpage}}
```

```
574 \newcommand\AtVeryEndDocument {\AddToHook{enddocument/afteraux}}
```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in `enddocument/info`.

```
575 \newcommand\AtEndAfterFileList{\AddToHook{enddocument/info}}
```

```
576 \newcommand\AtVeryVeryEnd    {\AddToHook{enddocument/end}}
```

`\BeforeClearDocument` This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```
577 \ExplSyntaxOn
```

```
578 \newcommand\BeforeClearDocument[1]
```

```
579   { \AtEndDocument{#1}
```

```
580     \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
```

```
581   }
```

```
582 \cs_new:Npn\atveryend@DEPRECATED #1
```

```
583   {\iow_term:x{=====~DEPRECATED~USAGE~#1~=====}}
```

```
584 \ExplSyntaxOff
```

(End of definition for `\BeforeClearDocument`.)

```
585 </atveryend-ltx>
```

File 52

ltshipout.dtx

1 Introduction

The code provides an interface to the `\shipout` primitive of \TeX which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.⁵¹

1.1 Overloading the `\shipout` primitive

`\shipout` With this implementation \TeX 's `shipout` primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each shipout that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a \LaTeX counter.

`\RawShipout` This command implements a simplified shipout that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total shipout counters are incremented.

The command doesn't use `\ShipoutBox` but its own private box register so that it can be used inside of shipout hooks to do some additional shipouts while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

⁵¹Heiko's interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

`\ShipoutBox`
`\l_shipout_box` This box register is called `\ShipoutBox` (alternatively available via the L3 name `\l_shipout_box`).

This box is a “local” box and assignments to it should be done only locally. Global assignments (as done by some packages with older code where this box is known as 255) may work but they are conceptually wrong and may result in errors under certain circumstances.

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

`\l_shipout_box_ht_dim`
`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no L^AT_EX 2_ε names).⁵² These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

1.2 Provided hooks

`shipout/before`
`shipout/after`
`shipout/foreground`
`shipout/background`
`shipout/firstpage`
`shipout/lastpage` The code for `\shipout` offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

shipout/before This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`. It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn't yet include the background and foreground material).

Note: It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

shipout/background This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of `1pt`.

It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

⁵²Might need changing, but HO's version as strings is not really helpful I think).

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

shipout/foreground This hook adds a `picture` environment into the foreground of the page with the $(0,0)$ coordinate in the top-left corner using a `\unitlength` of `1pt`. Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its $(0,0)$ point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout This hook is executed after foreground and/or background material has been added, i.e., just in front of the actual shipout operation. Its purpose is to allow manipulation of the finalized box (stored in `\ShipoutBox`) with the extra material also in place (which is not yet the case in `shipout/before`).

It cannot be used to cancel the shipout operation via `\DiscardShipoutBox` (that has to happen in `shipout/before`, if desired!

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the `.dvi` or `.pdf` output.⁵³

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

shipout/lastpage The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that `LATEX` believes is the last one. Again it is executed regardless of the shipout method.

It may not be possible for `LATEX` to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then `LATEX` will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

shipout/after This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to `shipout/before` it now includes the background and foreground material).

Note: Just like `shipout/before` this hook is not meant to be used for adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except `shipout` and `shipout/after`) are added inside `hboxes` to the box being shipped out in the following order:

⁵³In `LATEX 2ε` that was already existing, but implemented using a box register with the name `\@begindvibox`.

<code>shipout/firstpage</code>	only on the first page
<code>shipout/background</code>	
<code><boxed content of \ShipoutBox></code>	
<code>shipout/foreground</code>	
<code>shipout/lastpage</code>	only on the last page

If any of the hooks has no code then the corresponding box is added at that point.

Once the (page) box has got the above extra content it can again be manipulated using the `shipout` hook and then is shipped out for real.

Once the (page) box has been shipped out the `shipout/after` hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

1.3 Legacy L^AT_EX commands

`\AtBeginDvi` `\AtBeginDvi` `{(code)}`

`\AtEndDvi`

`\AtBeginDvi` is the existing L^AT_EX 2_ε interface to fill the `shipout/firstpage` hook. This is not really a good name as it is not just supporting `.dvi` but also `.pdf` output or `.xdv`.

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

Neither interface can set a code label but uses the current default label.

As these two wrappers have been available for a long time we continue offering them (but not enhancing them, e.g., by providing support for code labels).

For new code we strongly suggest using the high-level hook management commands directly instead of “randomly-named” wrappers. This will lead to code that is easier to understand and to maintain and it also allows you to set code labels if needed.

For this reason we do not provide any other “new” wrapper commands for the above hooks in the kernel, but only keep the existing ones for backward compatibility.

1.4 Special commands for use inside the hooks

`\DiscardShipoutBox` `\AddToHookNext {shipout/before} {...\DiscardShipoutBox...}`
`\shipout_discard:`

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that `LATEX` output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it — not done (yet)

`\DiscardShipoutBox` cannot be used in any of the `shipout/...` hooks other than `shipout/before`.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout`, `shipout/background` or `shipout/foreground`.⁵⁴ If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

1.5 Provided Lua_{T_EX} callbacks

`pre_shipout_filter` Under Lua_{T_EX} the `pre_shipout_filter` Lua callback is provided which gets called directly after the `shipout` hook, immediately before the `shipout` primitive gets invoked. The signature is

```
function(<node> head)
  return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

⁵⁴If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

1.6 Information counters

<code>\ReadonlyShipoutCounter</code>	<code>\ifnum\ReadonlyShipoutCounter=...</code>
<code>\g_shipout_readonly_int</code>	<code>\int_use:N \g_shipout_readonly_int % expl3 usage</code>

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a \LaTeX counter but as a \TeX counter (i.e., a command), so `\Alph{\ReadonlyShipoutCounter}` etc, would not work.

<code>totalpages</code>	<code>\arabic{totalpages}</code>
<code>\g_shipout_totalpages_int</code>	<code>\int_use:N \g_shipout_totalpage_int % expl3 usage</code>

In contrast to `\ReadonlyShipoutCounter`, the `totalpages` counter is a \LaTeX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by \LaTeX . It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by \LaTeX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

<code>\PreviousTotalPages</code>	<code>\thetotalpages/\PreviousTotalPages</code>
----------------------------------	---

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

1.7 Debugging shipout code

<code>\DebugShipoutsOn</code>	<code>\DebugShipoutsOn</code>
<code>\DebugShipoutsOff</code>	Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.
<code>\shipout_debug_on:</code>	
<code>\shipout_debug_off:</code>	

Todo: This needs some rationalizing and may not stay this way.

2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L^AT_EX kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

2.1 Emulating `atbegshi`

<code>\AtBeginShipoutUpperLeft</code>	<code>\AddToHook {shipout/before}</code>
<code>\AtBeginShipoutUpperLeftForeground</code>	<code>{... \AtBeginShipoutUpperLeft{<code>}...}</code>

This adds a `picture` environment into the background of the shipout box expecting `<code>` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

```
\AddToHook{shipout/background}{<code>}
```

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `<code>` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

<code>\AtBeginShipoutAddToBox</code>	<code>\AddToHook {shipout/before} {... \AtBeginShipoutAddToBox{<code>}...}</code>
<code>\AtBeginShipoutAddToBoxForeground</code>	

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `<code>` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `<code>` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

<code>\AtBeginShipoutBox</code>	This is the name of the shipout box as <code>atbegshi</code> knows it.
---------------------------------	--

<code>\AtBeginShipoutOriginalShipout</code>

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the L^AT_EX kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the L^AT_EX mechanisms and updates, for example, the `\ReadOnlyShipoutCounter` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

`\AtBeginShipoutInit` By default `atbegshi` delayed its action until `\begin{document}`. This command was forcing it in an earlier place. With the new concept it does nothing.

`\AtBeginShipout` `\AtBeginShipout{<code>}` \equiv `\AddToHook{shipout/before}{<code>}`
`\AtBeginShipoutNext` `\AtBeginShipoutNext{<code>}` \equiv `\AddToHookNext{shipout/before}{<code>}`

This is equivalent to filling the `shipout/before` hook by either using `\AddToHook` or `\AddToHookNext`, respectively.

`\AtBeginShipoutFirst` The `atbegshi` names for `\AtBeginDvi` and `\DiscardShipoutBox`.
`\AtBeginShipoutDiscard`

2.2 Emulating `everyshi`

The `everyshi` package is providing commands to run arbitrary code just before the shipout starts. One point of difference: in the new shipout hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cclv`.

`\EveryShipout` `\EveryShipout{<code>}` \equiv `\AddToHook{shipout/before}{<code>}`

`\AtNextShipout` `\AtNextShipout{<code>}` \equiv `\AddToHookNext{shipout/before}{<code>}`

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

2.3 Emulating `atenddvi`

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

2.4 Emulating `everypage`

This package patched the original `\@begindvi` hook and replaced it with its own version. Its functionality is now covered by the hooks offered by the kernel so that there is no need for such patching any longer.

`\AddEverypageHook` `\AddEverypageHook{<code>}` \equiv
`\AddToHook{shipout/background}{\put(1in,-1in){<code>}}`

`\AddEverypageHook` is adding something into the background of every page at a position of 1in to the right and 1in down from the top left corner of the page. By using the kernel hook directly you can put your material directly to the right place, i.e., use other coordinates in the `\put` statement above.

`\AddThispageHook` `\AddThispageHook{<code>}` \equiv
`\AddToHookNext{shipout/background}{\put(1in,-1in){<code>}}`

The `\AddThispageHook` wrapper is similar but uses `\AddToHookNext`.

3 The Implementation

```
1 <@@=shipout>
```

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 <*2ekernel | latexrelease>
3 <latexrelease>\IncludeInRelease{2020/10/01}%
4 <latexrelease>          {\shipout}{Hook management (shipout)}%
5 \ExplSyntaxOn
```

3.1 Debugging

`\g__shipout_debug_bool` Holds the current debugging state.

```
6 \bool_new:N \g__shipout_debug_bool
```

(End of definition for \g__shipout_debug_bool.)

`\shipout_debug_on:` Turns debugging on and off by redefining `__shipout_debug:n`.

```
\shipout_debug_off:
  \__shipout_debug:n
\__shipout_debug_gset:
7 \cs_new_eq:NN \__shipout_debug:n \use_none:n
8 \cs_new_protected:Npn \shipout_debug_on:
9   {
10    \bool_gset_true:N \g__shipout_debug_bool
11    \__shipout_debug_gset:
12   }
13 \cs_new_protected:Npn \shipout_debug_off:
14   {
15    \bool_gset_false:N \g__shipout_debug_bool
16    \__shipout_debug_gset:
17   }
18 \cs_new_protected:Npn \__shipout_debug_gset:
19   {
20    \cs_gset_protected:Npx \__shipout_debug:n ##1
21    { \bool_if:NT \g__shipout_debug_bool {##1} }
22   }
```

(End of definition for \shipout_debug_on: and others. These functions are documented on page 1015.)

`\ShipoutBox` The box filled with the page to be shipped out (both L3 and L^AT_EX 2_ε name).

```
\l_shipout_box
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

(End of definition for \ShipoutBox and \l_shipout_box. These functions are documented on page 1011.)

`\l__shipout_raw_box` The `\RawShipout` gets its own box but it is internal as there is no hook manipulation for it.

```
25 \box_new:N \l__shipout_raw_box
```

(End of definition for \l__shipout_raw_box.)

`__shipout_finalize_box:` For LuaTeX invoke the `pre_shipout_filter` callback.

```
26 \sys_if_engine luatex:TF
27 {
28   \newprotectedluacmd \__shipout_finalize_box:
29   \exp_args:Nx \everyjob {
30     \exp_not:V \everyjob
31     \exp_not:N \lua_now:n {
32       luatexbase.create_callback('pre_shipout_filter', 'list')
33       local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~
34       lua.get_functions_table()[\the \allocationnumber] = function()
35         local~head = getbox(\the \l_shipout_box)
36         local~result = call('pre_shipout_filter', head)
37         if~not (result == head) then~
38           setbox(\the \l_shipout_box, result~or~nil)
39         end~
40       end
41     }
42   }
43 } {
44   \cs_set_eq:NN \__shipout_finalize_box: \scan_stop:
45 }
```

(End of definition for __shipout_finalize_box:.)

`__shipout_execute:` This is going to be the code run by `\shipout`. The code follows closely the ideas from atbegshi, so not documenting that here for now.

```
46 \cs_set_protected:Npn \__shipout_execute: {
47   \tl_set:Nx \l__shipout_group_level_tl
48   { \int_value:w \tex_currentgrouplevel:D }
49   \tex_afterassignment:D \__shipout_execute_test_level:
50   \tex_setbox:D \l_shipout_box
51 }
```

(End of definition for __shipout_execute:.)

`\shipout` Overloading the `\shipout` primitive:

```
52 \cs_gset_eq:NN \shipout \__shipout_execute:
```

(End of definition for \shipout. This function is documented on page 1010.)

`\l__shipout_group_level_tl` Helper token list to record the group level at which `__shipout_execute:` is encountered.

```
53 \tl_new:N \l__shipout_group_level_tl
```

(End of definition for \l__shipout_group_level_tl.)

`__shipout_execute_test_level:` If the group level has changed then we are still constructing `\l_shipout_box` and to continue we need to wait until the current group has finished, hence the `\tex_aftergroup:D`.

```
54 \cs_new:Npn \__shipout_execute_test_level: {
55   \int_compare:nNnT
56     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
57     \tex_aftergroup:D \__shipout_execute_cont:
58 }
```

(End of definition for __shipout_execute_test_level:.)

`__shipout_execute_cont:` This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to `__shipout_execute_main_cont:Nnnn`; the first argument is the box to be shipped out.

```

59 \cs_new:Npn \__shipout_execute_cont: {
60   \__shipout_execute_main_cont:Nnnn
61     \l_shipout_box
62     { \hook_use:n {shipout/before} }
63     { \hook_if_empty:nF {shipout/foreground}
64       { \__shipout_add_foreground_picture:n
65         { \hook_use:n {shipout/foreground} } } }

```

If the user hook for the background (`shipout/background`) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the `\@kernel@before@shipout@background` though. If the `\@kernel@after@shipout@background` needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```

66     \bool_lazy_and:nnF
67     { \hook_if_empty_p:n {shipout/background} }
68     { \tl_if_empty_p:N \@kernel@before@shipout@background }
69     { \__shipout_add_background_picture:n
70       { \@kernel@before@shipout@background
71         \hook_use:n {shipout/background}
72         \@kernel@after@shipout@background }
73     }
74   }
75   { \hook_use:n {shipout/after} }
76 }

```

(End of definition for `__shipout_execute_cont:.`)

`_shipout_execute_main_cont:Nnnn` When we have reached this point the shipout box has been processed and is available in `\l_shipout_box` and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by `\RawShipout`. The only hook that is always executed is that for the very last page, i.e., `shipout/lastpage`.

First we quickly check if it is void (can’t happen in the standard L^AT_EX output routine but `\shipout` might be called from a package that has some special processing logic). If it is void we aren’t shipping anything out and processing ends.⁵⁵

```

77 \cs_new:Npn \__shipout_execute_main_cont:Nnnn #1#2#3#4 {
78   \box_if_empty:NTF #1
79   { \@latex@warning@no@line{ Ignoring~ void~ shipout~ box } }
80   {

```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of `\protect` while we are running the hook code). We also save the current `\protect` state to restore it later.

```

81 %       \bool_gset_false:N \g__shipout_discard_bool % setting this would disable
82                                     % \DiscardShipoutBox on doc-level

```

⁵⁵In that case we don’t reset the deadcycles, that would be up to the OR processing logic to do.

```

83     \cs_set_eq:NN \__shipout_saved_protect: \protect
84     \set@typeset@protect

```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.⁵⁶

```

85     \__shipout_get_box_size:N #1

```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```

86     #2

```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_readonly_int` are in sync while the hook is executed (in the case that `totalpages` isn't manually altered or through discarding pages that is).

```

87     \int_gincr:N \g_shipout_totalpages_int

```

The above hook might contain code that requests the page to be discarded so we now test for it.

```

88     \bool_if:NTF \g__shipout_discard_bool
89     { \@latex@info@no@line{Completed~ page~ discarded}
90     \bool_gset_false:N \g__shipout_discard_bool

```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset TeX's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```

91     \tex_deadcycles:D \c_zero_int

```

Todo: In atbegshi the box was dropped but is that actually needed? Or the resetting of \protect to its kernel value?

```

92 %     \group_begin:
93 %     \box_set_eq_drop:NN #1 #1
94 %     \group_end:
95 %     \cs_set_eq:NN \protect \exp_not:N
96     }

```

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97     { \box_if_empty:NTF #1
98     { \@latex@warning@no@line { Ignoring~ void~ shipout~ box.
99     \MessageBreak The~ shipout~ box~ was~ voided~ by~ hook~ code }
100     }

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.⁵⁷

```

101     {

```

⁵⁶This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

⁵⁷Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

```

102         \int_gincr:N \g_shipout_readonly_int
103         \__shipout_debug:n {
104             \typeout{Absolute~ page~ =~ \int_use:N \g_shipout_readonly_int
105                 \space (target:~ \@abspage@last)}
106         }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```

107         \__shipout_get_box_size:N #1

```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `__shipout_add_firstpage_specials:`.

```

108         \__shipout_run_firstpage_hook:

```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l_shipout_box` so that firstpage and lastpage material gets added if necessary (that is always done to `\l_shipout_box`).

```

109         #3

```

We then run `__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```

110         \__shipout_add_firstpage_specials:

```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

111         \int_compare:nNnT \@abspage@last = \g_shipout_readonly_int
112         { \bool_lazy_and:nnF
113             { \hook_if_empty_p:n {shipout/lastpage} }
114             { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
115             { \__shipout_debug:n { \typeout{Executing~ lastpage~ hook~
116                 on~ page~ \int_use:N \g_shipout_readonly_int } }
117             \__shipout_add_foreground_box:n
118             { \UseHook{shipout/lastpage}
119             \@kernel@after@shipout@lastpage }

```

We record that we have handled the `shipout/lastpage` hook but only if we really did.

```

120         \bool_gset_true:N \g__shipout_lastpage_handled_bool
121     }
122 }

```

```

123     \hook_use:n {shipout}
124     \__shipout_finalize_box:

```

Finally we run the actual `TeX` primitive for `shipout`. As that will expand delayed `\write` statements inside the page in which protected commands should not expand we first change `\protect` to the appropriate definition for that case.

```

125         \cs_set_eq:NN \protect \exp_not:N
126         \tex_shipout:D \box_use:N \l_shipout_box

```

The `\l_shipout_box` may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets `\l_shipout_box` to its earlier state if that is necessary. On later pages this is then a no-op.

```
127         \__shipout_drop_firstpage_specials:
```

The `shipout/after` hook (if in #4) needs to run with `\protected` commands again being executed, because that hook will “typeset” material added at the top of the next page.

```
128         \set@typeset@protect
129         #4
130     }
131 }
```

Restore the value of `\protect` in case `\shipout` is called outside of the output routine (where it is automatically restored because of the implicit group).

```
132     \cs_set_eq:NN \protect \__shipout_saved_protect:
133 }
134 }
```

(End of definition for `__shipout_execute_main_cont:Nnnn`.)

`__shipout_execute_raw:` This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than `__shipout_execute_raw:` except that it finally calls `__shipout_execute_main_cont:Nnnn` with three empty arguments. instead of the hook code.

```
135 \cs_set_protected:Npn \__shipout_execute_raw: {
136     \tl_set:Nx \l__shipout_group_level_tl
137     { \int_value:w \tex_currentgrouplevel:D }
138     \tex_afterassignment:D \__shipout_execute_test_level_raw:
139     \tex_setbox:D \l__shipout_raw_box
140 }

141 \cs_new:Npn \__shipout_execute_test_level_raw: {
142     \int_compare:nNnT
143     \l__shipout_group_level_tl < \tex_currentgrouplevel:D
144     \tex_aftergroup:D \__shipout_execute_nohooks_cont:
145 }
```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```
146 \cs_new:Npn \__shipout_execute_nohooks_cont: {
147     \__shipout_execute_main_cont:Nnnn \l__shipout_raw_box
148     {} { \__shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} } }
149     \box_set_eq:NN \l_shipout_box \l__shipout_raw_box } {}
150 }
```

(End of definition for `__shipout_execute_raw:` and `__shipout_execute_test_level_raw:.`)

`\RawShipout` The interface name for raw shipout.

```
151 \cs_gset_eq:NN \RawShipout \__shipout_execute_raw:
```

(End of definition for `\RawShipout`. This function is documented on page 1010.)

`__shipout_saved_protect:` Remember the current `\protect` state.

```
152 \cs_new_eq:NN \__shipout_saved_protect: \protect
```

(End of definition for `_shipout_saved_protect:`.)

```
shipout/before Declaring all hooks for the shipout code.
shipout
shipout/after 153 \hook_new:n{shipout/before}
154 \hook_new:n{shipout}
shipout/foreground 155 \hook_new:n{shipout/after}
156 \hook_new:n{shipout/foreground}
shipout/background 157 \hook_new:n{shipout/background}
158 \hook_new:n{shipout/firstpage}
shipout/firstpage 159 \hook_new:n{shipout/lastpage}
shipout/lastpage
```

(End of definition for `shipout/before` and others. These functions are documented on page 1011.)

```
\@kernel@after@shipout@lastpage And here are the internal kernel hooks going before or after the public ones where needed.
\@kernel@before@shipout@background
\@kernel@after@shipout@background 160 \let\@kernel@after@shipout@lastpage\@empty
161 \let\@kernel@before@shipout@background\@empty
162 \let\@kernel@after@shipout@background\@empty
```

(End of definition for `\@kernel@after@shipout@lastpage`, `\@kernel@before@shipout@background`, and `\@kernel@after@shipout@background`.)

```
\_shipout_run_firstpage_hook: There are three commands to handle the shipout/firstpage hook: \_shipout_run_
firstpage_hook:, \_shipout_add_firstpage_specials: and \_shipout_drop_
firstpage_specials:.
```

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed “first”, e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `_shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```
163 \cs_new:Npn \_shipout_run_firstpage_hook: {
164   \hook_if_empty:nTF {shipout/firstpage}
```

If not then we define the other two commands to do nothing.

```
165   {
166     \cs_gset_eq:NN \_shipout_add_firstpage_specials: \prg_do_nothing:
167     \cs_gset_eq:NN \_shipout_drop_firstpage_specials: \prg_do_nothing:
168   }
```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```
169   {
170     \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }
171   }
```

Once we are here we change the definition to do nothing next time and we also change the command used to implement `\AtBeginDvi` to become a warning and not add further material to a hook that is never used again.

```

172 \cs_gset_eq:NN \__shipout_run_firstpage_hook: \prg_do_nothing:
173 \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
174   \@latex@warning{ First~ page~ is~ already~ shipped~ out,~ ignoring
175                   \MessageBreak \string##1 }
176 }
177 }

```

(End of definition for `__shipout_run_firstpage_hook:`.)

`__shipout_add_firstpage_specials:` The `__shipout_add_firstpage_specials:` then adds the `\specials` stored in `\l__shipout_firstpage_box` to the page to be shipped out when the time is ready. Note that if there was no material in the `shipout/firstpage` hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some meta data declaration, etc. so by default we assume there is something to do.

```

178 \cs_new:Npn \__shipout_add_firstpage_specials: {

```

First we make a copy of the `\l_shipout_box` that we can restore it later on.

```

179 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box

```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```

180 \__shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }

```

After the actual shipout `__shipout_drop_firstpage_specials:` is run to restore the earlier content of `\l_shipout_box` and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```

181 \cs_gset_eq:NN \__shipout_add_firstpage_specials: \prg_do_nothing:
182 }

```

The `__shipout_drop_firstpage_specials:` is run after the shipout has occurred but before the `shipout/afterpage` hook is executed. That is the point where we have to restore the `\ShipoutBox` to its state without the `shipout/firstpage` material.

```

183 \cs_new:Npn \__shipout_drop_firstpage_specials: {
184   \box_set_eq:NN \l_shipout_box \l__shipout_raw_box

```

If there was no such material then `__shipout_run_firstpage_hook:` will have changed the definition to a no-op already. Otherwise this is what we do here.

```

185 \cs_gset_eq:NN \__shipout_drop_firstpage_specials: \prg_do_nothing:
186 }

```

(End of definition for `__shipout_add_firstpage_specials:` and `__shipout_drop_firstpage_specials:`.)

`\l__shipout_firstpage_box` The box to hold any firstpage `\specials`.

```

187 \box_new:N \l__shipout_firstpage_box

```

(End of definition for `\l__shipout_firstpage_box:`.)

`\g__shipout_lastpage_handled_bool` A boolean to signal if we have already handled the `shipout/lastpage` hook.

```

188 \bool_new:N \g__shipout_lastpage_handled_bool

```

(End of definition for `\g__shipout_lastpage_handled_bool:`.)

`_shipout_add_firstpage_material:N` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```
189 \cs_new:Npn \_shipout_add_firstpage_material:Nn #1#2 {
190   \AddToHook{shipout/firstpage}{#2}
191 }
```

(End of definition for `_shipout_add_firstpage_material:Nn`.)

`_shipout_get_box_size:N` Store the box dimensions in dimen registers.

Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.

```
192 \cs_new:Npn \_shipout_get_box_size:N #1 {
193   \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
194   \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
195   \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
196   \dim_set:Nn \l_shipout_box_ht_plus_dp_dim
197     { \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }
198 }
```

(End of definition for `_shipout_get_box_size:N`.)

`\l_shipout_box_ht_dim` And here are the variables set by `_shipout_get_box_size:N`.

```
\l_shipout_box_dp_dim 199 \dim_new:N \l_shipout_box_ht_dim
\l_shipout_box_wd_dim 200 \dim_new:N \l_shipout_box_dp_dim
\l_shipout_box_ht_plus_dp_dim 201 \dim_new:N \l_shipout_box_wd_dim
202 \dim_new:N \l_shipout_box_ht_plus_dp_dim
```

(End of definition for `\l_shipout_box_ht_dim` and others. These functions are documented on page 1011.)

`\g_shipout_discard_bool` Indicate whether or not the current page box should be discarded

```
203 \bool_new:N \g_shipout_discard_bool
```

(End of definition for `\g_shipout_discard_bool`.)

`\l_shipout_tmp_box` We need a box for the background and foreground material and a token register to

`\l_shipout_saved_badness_tl` remember badness settings as we disable them during the buildup below.

```
204 \box_new:N \l_shipout_tmp_box
205 \tl_new:N \l_shipout_saved_badness_tl
```

(End of definition for `\l_shipout_tmp_box` and `\l_shipout_saved_badness_tl`.)

`_shipout_add_background_box:n` In standard L^AT_EX the shipout box is always a `\vbox` but here we are allow for other usage as well, in case some package has its own output routine.

```
206 \cs_new:Npn \_shipout_add_background_box:n #1
207 { \_shipout_get_box_size:N \l_shipout_box
```

But we start testing for a vertical box as that should be the normal case.

```
208   \box_if_vertical:NTF \l_shipout_box
209     {
```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```

210     \tl_set:Nx \l__shipout_saved_badness_tl
211     { \vfuzz=\the\vfuzz\relax
212       \vbadness=\the\vbadness\relax }
213     \vfuzz=\c_max_dim
214     \vbadness=\c_max_int

```

Then we reconstruct `\l_shipout_box` ...

```

215     \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
216     {

```

... the material in #1 is placed into a horizontal box with zero dimensions.

```

217         \hbox_set:Nn \l__shipout_tmp_box
218         { \l__shipout_saved_badness_tl #1 }
219         \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
220         \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
221         \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

The we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```

222         \skip_zero:N \baselineskip
223         \skip_zero:N \lineskip
224         \skip_zero:N \lineskiplimit
225         \box_use:N \l__shipout_tmp_box
226         \vbox_unpack:N \l_shipout_box

```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```

227         \kern \c_zero_dim
228     }
229     \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
230     \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim

```

Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

```

231     \l__shipout_saved_badness_tl
232   }
233   {

```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```

234     \box_if_horizontal:NT \l_shipout_box
235     {
236         \tl_set:Nx \l__shipout_saved_badness_tl
237         { \hfuzz=\the\hfuzz\relax
238           \hbadness=\the\hbadness\relax }
239         \hfuzz=\c_max_dim
240         \hbadness=\c_max_int
241         \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
242         {
243             \hbox_set:Nn \l__shipout_tmp_box
244             { \l__shipout_saved_badness_tl #1 }
245             \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
246             \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
247             \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim

```

```

248         \box_move_up:nn
249         \l_shipout_box_ht_dim
250         { \box_use:N \l__shipout_tmp_box }
251         \hbox_unpack:N \l_shipout_box
252     }
253     \l__shipout_saved_badness_tl
254 }
255 }
256 }

```

(End of definition for __shipout_add_background_box:n.)

_shipout_add_foreground_box:n Foreground boxes are done in the same way, only the order and placement of boxes has to be done differently.

```

257 \cs_new:Npn \__shipout_add_foreground_box:n #1
258 {
259   \box_if_vertical:NTF \l_shipout_box
260   {
261     \tl_set:Nx \l__shipout_saved_badness_tl

302         \box_move_up:nn { \box_ht:N \l__shipout_box }
303             { \box_use:N \l__shipout_tmp_box }
304         \kern \box_wd:N \l__shipout_box
305     }%
306     \l__shipout_saved_badness_tl
307 }
308 }
309 }

```

(End of definition for `__shipout_add_foreground_box:n`.)

`__shipout_init_page_origins:` Two constants holding the offset of the top-left with respect to the media box.
`\c__shipout_horigin_tl` Setting the constants this way is courtesy of Bruno.
`\c__shipout_vorigin_tl` We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `begindocument` hook that affects their setup.

```

310 \cs_new:Npn \__shipout_init_page_origins: {
311   \tl_const:Nx \c__shipout_horigin_tl
312     {
313       \cs_if_exist_use:NTF \pdfvariable { horigin }
314         { \cs_if_exist_use:NF \pdfhorigin { 1in } }
315     }
316   \tl_const:Nx \c__shipout_vorigin_tl
317     {
318       \cs_if_exist_use:NTF \pdfvariable { vorigin }
319         { \cs_if_exist_use:NF \pdfvorigin { 1in } }
320     }

```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

321   \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
322 }

```

(End of definition for `__shipout_init_page_origins:`, `\c__shipout_horigin_tl`, and `\c__shipout_vorigin_tl`.)

`__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.

```

323 \cs_new:Npn \__shipout_picture_overlay:n #1 {

```

The very first time this is executed we have to initialize (and freeze) the origins.

```

324   \__shipout_init_page_origins:
325   \kern -\c__shipout_horigin_tl \scan_stop:
326   \vbox_to_zero:n {
327     \kern -\c__shipout_vorigin_tl \scan_stop:
328     \unitlength 1pt \scan_stop:

```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width).

```

329     \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
330         { \ignorespaces #1 \hss }
331     \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
332     \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
333     \box_use:N \l__shipout_tmp_box
334     \tex_vss:D
335 }
336 }

```

(End of definition for `__shipout_picture_overlay:n`.)

`__shipout_add_background_picture:n` Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```

337 \cs_new:Npn \__shipout_add_background_picture:n #1 {
338     \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
339 }

```

(End of definition for `__shipout_add_background_picture:n`.)

`__shipout_add_foreground_picture:n` Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```

340 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
341     \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
342 }

```

(End of definition for `__shipout_add_foreground_picture:n`.)

`\shipout_discard:` Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case \LaTeX looks ahead and is not using the position for on the next page).

```

343 \cs_new_protected:Npn \shipout_discard: {
344     \bool_gset_true:N \g__shipout_discard_bool
345 }

```

(End of definition for `\shipout_discard:`. This function is documented on page 1014.)

3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

`\g_shipout_readonly_int` We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

```

346 \int_new:N \g_shipout_readonly_int

```

For $\LaTeX 2_\epsilon$ it is available as a command (i.e., a \TeX counter only).

```

347 \cs_new_eq:NN \ReadonlyShipoutCounter \g_shipout_readonly_int

```

(End of definition for `\g_shipout_readonly_int` and `\ReadonlyShipoutCounter`. These functions are documented on page 1015.)

`\g_shipout_totalpages_int` We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

```
348 \int_new:N \g_shipout_totalpages_int
```

For L^AT_εX this is offered as a L^AT_εX counter so can be easily typeset inside the output routine to display things like “\thepage/\thetotalpages”, etc.

```
349 \cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int
```

```
350 \cs_new:Npn \thetotalpages { \arabic{totalpages} }
```

(End of definition for \g_shipout_totalpages_int and \c@totalpages. These functions are documented on page 1015.)

`\@abspage@last` In `\@abspage@last` record the number of pages from the last run. This is written to the .aux and this way made available to the next run. In case there is no .aux file or the statement is missing from it we initialize it with the largest possible number in T_EX. We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

```
351 \xdef\@abspage@last{\number\maxdimen}
```

(End of definition for \@abspage@last.)

`\enddocument` Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don't know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

```
\@kernel@after@enddocument 352 \g@addto@macro \@kernel@after@enddocument {
353   \int_compare:nNnT \@abspage@last = \maxdimen
354   {
```

We use L^AT_εX coding as `\@abspage@last` is not an L₃ name.

```
355     \xdef\@abspage@last{ \int_eval:n {\g_shipout_readonly_int + 1} }
356   }
357 }
```

`\@kernel@after@enddocument@afterlastpage` Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the .aux file for the next run.

```
358 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to run the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
359   \int_compare:nNnF \g_shipout_readonly_int = 0
360   {
```

This ends up in the .aux so we use L^AT_εX names here.

Todo: This needs an interface for \nofiles in expl3, doesn't at the moment!

```
361     \if@filesw
362         \iow_now:Nx \@auxout {
363             \gdef\string\@abspage@last {\int_use:N \g_shipout_readonly_int}}
364     \fi
```

But we may have guessed wrongly earlier and have run it too early or we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy. In either case we should put out an appropriate “rerun” warning.

```
365     \bool_if:NTF \g__shipout_lastpage_handled_bool
366     {
```

If the hook was already executed, we have to test if that total shipouts match the shipouts from last run (because that corresponds to the page it was executed). If not we output a warning.

```
367         \int_compare:nNnF \@abspage@last = \g_shipout_readonly_int
368         {
369             \@latex@warning@no@line{Hook~ 'shipout/lastpage'~ executed-
370 on~ wrong~ page~ (\@abspage@last\space not~
371 \int_use:N\g_shipout_readonly_int).\MessageBreak
372 Rerun~ to~ correct~ this}%
373         }
374     }
375     {
```

If the hook was not run, we need to add an extra page and place it there. However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```
376         \bool_lazy_and:nnF
377         { \hook_if_empty_p:n {shipout/lastpage} }
378         { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
379         {
380             \tex_shipout:D\ vbox to\textheight
381             {
382                 \hbox:n { \UseHook{shipout/lastpage}
383 \@kernel@after@shipout@lastpage }

```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```
384             \__shipout_excuse_extra_page:
385             \null
386         }
```

At this point we also signal to L^AT_EX's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```
387         \cs_gset_eq:NN \@extra@page@added \relax
388     }
389 }
390 }
391 }
```

(End of definition for `\enddocument`, `\@kernel@after@enddocument`, and `\@kernel@after@enddocument@afterlastpage`.)

```
\_shipout_excuse_extra_page: Say mea culpa ...
392 \cs_new:Npn \_shipout_excuse_extra_page: {

```

(End of definition for `_shipout_excuse_extra_page:.`)

\PreviousTotalPages In the preamble before the aux file was read `\PreviousTotalPages` is always zero.
`\@kernel@before@begindocument`

```
407 \def\PreviousTotalPages{0}
In the aux file there should be an update for \@abspage@last recording the number of
pages from the previous run. If not that macro holds the value of \maxdimen. So we test
for it and update \PreviousTotalPages if there was a real value. This should happen
just before the begindocument hook is executed so that the value can be used inside that
hook.
```

```
408 \g@addto@macro\@kernel@before@begindocument
409   {\ifnum\@abspage@last<\maxdimen
410     \xdef\PreviousTotalPages{\@abspage@last}\fi}
```

(End of definition for `\PreviousTotalPages` and `\@kernel@before@begindocument`. These functions are documented on page 1015.)

4 Legacy L^AT_EX 2_ε interfaces

\DiscardShipoutBox Request that the next shipout box is to be discarded.

```
411 \cs_new_eq:NN \DiscardShipoutBox \shipout_discard:
```

(End of definition for `\DiscardShipoutBox`. This function is documented on page 1014.)

\AtBeginDvi If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.

```
412 \cs_set_protected:Npn \AtBeginDvi
413   {\_shipout_add_firstpage_material:Nn \AtBeginDvi}
```

(End of definition for `\AtBeginDvi`. This function is documented on page 1013.)

\DebugShipoutsOn
\DebugShipoutsOff

```
414 \cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:
415 \cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:
```

(End of definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page 1015.)

5 Internal commands needed elsewhere

These internal commands use double and triple @ signs so we need to stop getting them translated to the module name.

416 <@=@>

Some internals needed elsewhere.

```

6 Package emulation for compatibility

6.1 Package `atenddvi` emulation

`\AtEndDvi` This package has only one public command, so simulating it is easy and actually sensible to provide as part of the kernel.

```

468 </2kernel>
469 <*2kernel | latexrelease>
470 <latexrelease>\IncludeInRelease{2020/10/01}%
471 <latexrelease>          {\AtEndDvi}{atenddvi emulation}%
472 \ExplSyntaxOn
473 \cs_new_protected:Npn \AtEndDvi #1 {\AddToHook{shipout/lastpage}{#1}}
474 \ExplSyntaxOff

```

As the package is integrate we prevent loading (no need to roll that back):

```

475 \disable@package@load{atenddvi}
476   {\PackageWarning{atenddvi}
477     {Functionality of this package is already\MessageBreak
478     provided by LaTeX.\MessageBreak\MessageBreak
479     It is there no longer necessary to load it\MessageBreak
480     and you can safely remove it.\MessageBreak
481     Found on}}
482 </2kernel | latexrelease>

```

```

483 <latexrelease>\EndIncludeInRelease
484 <latexrelease>\IncludeInRelease{0000/00/00}%
485 <latexrelease>          {\AtEndDvi}{atenddvi emulation}%
486 <latexrelease>\let \AtEndDvi \@undefined
487 <latexrelease>\EndIncludeInRelease
488 <*2ekernel>

```

(End of definition for \AtEndDvi. This function is documented on page 1013.)

```
489 </2ekernel>
```

6.2 Package atbegshi emulation

```

490 <*atbegshi-ltx>
491 \ProvidesPackage{atbegshi-ltx}
492     [2021/01/10 v1.0c
493     Emulation of the original atbegshi^^Jpackage with kernel methods]

```

\AtBeginShipoutBox

```
494 \let \AtBeginShipoutBox \ShipoutBox
```

(End of definition for \AtBeginShipoutBox. This function is documented on page 1016.)

\AtBeginShipoutInit

Compatibility only, we aren't delaying ...

```
495 \let \AtBeginShipoutInit \@empty
```

(End of definition for \AtBeginShipoutInit. This function is documented on page 1017.)

\AtBeginShipout \AtBeginShipoutNext

Filling hooks

```

496 \protected\long\def\AtBeginShipout    #1{\AddToHook{shipout/before}{#1}}
497 \protected\long\def\AtBeginShipoutNext #1{\AddToHookNext{shipout/before}{#1}}

```

(End of definition for \AtBeginShipout and \AtBeginShipoutNext. These functions are documented on page 1017.)

\AtBeginShipoutFirst

Slightly more complex as we need to know the name of the command under which the shipout/firstpage hook is filled.

```

498 \protected \def \AtBeginShipoutFirst
499     {\@expl@@@shipout@add@firstpage@material@@Nn \AtBeginShipoutFirst}

```

(End of definition for \AtBeginShipoutFirst. This function is documented on page 1017.)

\AtBeginShipoutDiscard

Just a different name.

```
500 \let \AtBeginShipoutDiscard \DiscardShipoutBox
```

(End of definition for \AtBeginShipoutDiscard. This function is documented on page 1017.)

\AtBeginShipoutAddToBox \AtBeginShipoutAddToBoxForeground \AtBeginShipoutUpperLeft \AtBeginShipoutUpperLeftForeground

We don't expose them.

```

501 \let \AtBeginShipoutAddToBox
502     \@expl@@@shipout@add@background@box@@n
503 \let \AtBeginShipoutAddToBoxForeground
504     \@expl@@@shipout@add@foreground@box@@n
505 \let \AtBeginShipoutUpperLeft
506     \@expl@@@shipout@add@background@picture@@n
507 \let \AtBeginShipoutUpperLeftForeground
508     \@expl@@@shipout@add@foreground@picture@@n

```

(End of definition for `\AtBeginShipoutAddToBox` and others. These functions are documented on page 1016.)

`\AtBeginShipoutOriginalShipout` This offers the raw `\shipout` primitive of the engine. A page shipped out with this is not counted by `\ReadonlyShipoutCounter` counter and thus the mechanism to place `\specials` at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
509 \ExplSyntaxOn
510 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End of definition for `\AtBeginShipoutOriginalShipout`. This function is documented on page 1016.)

`\ShipoutBoxHeight`
`\ShipoutBoxWidth`
`\ShipoutBoxDepth` This is somewhat different from the original in `atbegshi` where `\ShipoutBoxHeight` etc. only holds the `\the\ht<box>` value. This may have some implications in some use cases and if that is a problem then it might need changing.

```
511 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
512 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
513 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
514 \ExplSyntaxOff
```

(End of definition for `\ShipoutBoxHeight`, `\ShipoutBoxWidth`, and `\ShipoutBoxDepth`.)

```
515 </atbegshi-ltx>
```

If the package is requested we substitute the one above:

```
516 <*2kernel>
517 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
518 </2kernel>
```

6.3 Package `everyshi` emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

```
519 <@@=>
```

File 53

ltoutput.dtx

1 Output Routine

1.1 Floats

The ‘2ekernel’ code ensures that a `\usepackage{autoout1}` is essentially ignored if a ‘full’ format is being used that has the autoload file mode already in the format.

```
1 <def>\begingroup
2 <def>\makeatletter
3 <def>\nfss@catcodes
4 <2ekernel>\expandafter\let\csname ver@autoout1.sty\endcsname\fmtversion
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```

*****
```

PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside       : boolean. T if two-sided printing
\oddsidemargin : IF @twoside = T
                THEN extra space added to left of odd-numbered
                pages.
                ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                THEN extra space added to left of even-numbered
                pages.
\headheight    : height of head
\headsep       : separation between head and text
\footskip      : distance separation between baseline of last
                line of text and baseline of foot.
                Note difference between \footSKIP and \headSEP.
\textheight    : height of text on page, excluding head and foot
\textwidth     : width of printing on page
\columnsep     : IF @twocolumn = T
                THEN width of space between columns
\columnseprule : IF @twocolumn = T
                THEN width of rule between columns (0 if none).
\columnwidth   : IF @twocolumn = T
                THEN (\textwidth - \columnsep)/2
                ELSE \textwidth
                It is set by the \twocolumn and
                \onecolumn commands.
```

- `\@textbottom` : Command executed at bottom of vbox holding text of page (including figures). The `\raggedbottom` command almost `\let`'s this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.
- `\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

- `\floatsep` : Space left between floats.
- `\textfloatsep` : Space between last top float or first bottom float and the text.
- `\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)
- `\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.
- `\intextsep` : Space left on top and bottom of an in-text float.
- `\dblfloatsep` : Space between double-column floats.
- `\dbltextfloatsep` : Space between top double-column floats and text.
- `\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.
- `\@fptop` : Glue to go at top of float column – must be 0pt + stretch
- `\@fpsep` : Glue to go between floats in a float column.
- `\@fpbot` : Glue to go at bottom of float column
– must be 0pt + stretch
- `\@dblfpptop`, `\@dblfpsep`, `\@dblfpbot`
: Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

- `@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

```

\@oddhead      : IF @twoside = T
                  THEN macro to generate head of odd-numbered
                  pages.
                  ELSE macro to generate head of all pages.
\@evenhead     : IF @twoside = T
                  THEN macro to generate head of even-numbered
                  pages.
\@oddfoot      : IF @twoside = T
                  THEN macro to generate foot of odd-numbered
                  pages.
                  ELSE macro to generate foot of all pages.
\@evenfoot     : IF @twoside = T
                  THEN macro to generate foot of even-numbered
                  pages.
@specialpage   : boolean. T if current page is to have a special
                  format.
\@specialstyle : If its value is foo then
                  IF @specialpage = T
                  THEN the command \ps@foo is executed to
                  temporarily reset the page style parameters
                  before composing the current page.
                  This command should execute only \def's and
                  \edef's, making only local definitions.

```

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.
When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- * For single-column page it equals `\textheight`.
- * For double-column page it equals `\textheight - height` of double-column floats on page.

Note that some are set globally and some locally:

```

\@topnum :=G Maximum number of floats allowed on the top of a
           column.
\@toproom :=G Maximum amount of top of column devoted to floats-
           excluding \textfloatsep separation below the floats
           and \floatsep separation between them. For
           two-column output, should be computed as a function
           of \@colht.
\@botnum, \@botroom
           : Analogous to above.
\@colnum :=G Maximum number of floats allowed in a column,
           including in-text floats.
\@textmin :=L Minimum amount of text (excluding footnotes) that
           must appear on a text page.
           %% 27 Sep 85 : made local to
           %% \@addtocurcol and \@addtonextcol
           It is now also used locally in processing double
           floats.

```

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\@dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed at the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblfpptop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\@footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty $<$ or $= -10000$ in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

penalty	reason
-10000	<code>\pagebreak</code> <code>\newpage</code>
-10001	<code>\clearpage</code> (<code>\penalty -10000 \vbox{} \penalty -10001</code>)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list: (i) a penalty of -10004, (ii) a null `\vbox` (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.
 Also sets `\@colht :=G \textheight`.
 The page style is determined as follows.
 IF `@thispagestyle = true`
 THEN use `\thispagestyle style`
 ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:
 `\@colht` : height of box
 `\@fpmin` : minimum height of floats in the box
 `\@fpsep` : interfloat space
 `\@fptop` : glue at top of box
 `\@fpbot` : glue at bottom of box.
 If it succeeds, then it does the following:
 * `\@outputbox :=L` the composed float box.
 * `@fcolmade :=G true`
 * `\FLIST :=G \FLIST` - floats put in box
 * `\@freelist :=G \@freelist +` floats put in box
 If it fails, then:
 * `@fcolmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :
 Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:
 * Globally sets `\@toplist` and `\@botlist` to floats

from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

- * Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolumn` :

Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

- * Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- * Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box

`\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\@TOPLIST` and `\@BOTLIST` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`

If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn = true`, then:

If `@firstcolumn = true`, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G false`.

If `@firstcolumn = false`, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
                \write -1{}    % Part of hack to make sure no
                \vbox{}        % \write's get lost.
                \penalty -10001
            END

\cleardoublepage == BEGIN \clearpage
                    if @twoside = true and c@page is even
                    then \hbox{} \newpage fi
            END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
and puts BOX in a parbox of width \textwidth across the top.
Useful for full-width titles for double-column pages.
SURPRISE: The stretch from \@dbltextfloatsep will be inserted
between the BOX and the top of the two columns.

```

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the \@freelist (see below for a description of list manipulation), puts the float into box B and sets \count B to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: \vadjust{\penalty -10002}
- In vmode : \penalty -10003.

For a double-column float, it puts B onto the \@dbldeferlist.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.
- * A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float

6 1 iff a type 2 float
etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```
\@elt \boxa ... \@elt \boxN
```

where `\boxI` is defined by

```
\newinsert\boxI
```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEMPTY}{EMPTY} == %% NOTE: ASSUME \@elt  
= \relax  
  BEGIN  assume that \LIST == \@elt \B1 ... \@elt \Bn  
        if n = 0  
        then  EMPTY  
        else  \CS :=L \B1  
              \LIST :=G \@elt \B2 ... \@elt \Bn  
              NONEMPTY  
        fi  
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all `I` of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.

I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier equal to 1.

Note: `log2 [(\count I)/32]` is the bit number corresponding to the type of float `I`. To see if there is any float in `\LIST` having the same type as float `I`, you run `\@bitor` with

```
\NUM = [(\count I)/32] * 32.
```

```
\@bitor\NUM\LIST ==  
  BEGIN  
    @test :=G false  
    { \@elt \CTR == if \NUM <> 0 then  
      if \count\CTR / \NUM is odd  
      then @test := true fi fi
```

```

\LIST
}
END

```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```

\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
      \LIST :=G \LIST \@elt \NUM
      }

```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

```

\@freelist      : List of empty boxes for placing new floats.
\@toplist       : List of floats to go at top of current column.
\@midlist       : List of floats in middle of current column.
\@botlist       : List of floats to go at bottom of current column.
\@deferlist     : List of floats to go after current column.
\@dbltoplist    : List of double-col. floats to go at top of current
                  page.
\@dbldeferlist  : List of double-column floats to go on subsequent
                  pages.

```

FLOAT-PLACEMENT ALGORITHMS

```

\@addtobot : Tries to put insert \@currbox on \@botlist.
             Called only when:
             * \ht BOX < \@colroom
             * type of \@currbox not on \@deferlist
             * \@colnum > 0
             * @insert = false
             If it succeeds, then:
             * sets @insert true
             * decrements \@botroom by \ht BOX
             * decrements \@botnum and \@colnum by 1
             * decrements \@colroom by \ht BOX + either \floatsep
               or \textfloatsep, as appropriate.
             * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                  * sets @insert true
                  * decrements \@toproom or \@botroom by \ht BOX
                  * decrements \@colnum and either \@topnum or
                    \@botnum by 1
                  * decrements \@colroom by \ht BOX + \floatsep

```

or `\textfloatsep`, as appropriate.

`\@addtocurcol` : Tries to add `\@currbox` to current column, setting `@insert` true if it succeeds, false otherwise.
It will add `\@currbox` to top only if bit 0 of `\count \@currbox` is 0, and to the bottom only if bit 0 = 0 or an earlier float of the same type is put on the bottom.
If the float is put in the text, then `\penalty\interlinepenalty` is put right after the float, before the following `\vskip`, and `\outputpenalty :=L 0`.

`\@addtonextcol` : Tries to add `\@currbox` to the next column, setting `@insert` true if it succeeds, false otherwise.

`\@addtodblcol` : Tries to add `\@currbox` to the next double-column page, adding it to `\@dbltoplist` if it succeeds and `\@dbldeferlist` if it fails.

```
\@addmarginpar ==
BEGIN
  if \@currlist nonempty
    then remove \@marbox from \@currlist
      add \@marbox and \@currbox to \@freelist
      %% NOTE: \@currbox = left box
    else LaTeX error: ? %% shouldn't happen
  fi
  \@tempcnta := 1      %% 1 = right, -1 = left
  if @twocolumn = true
    then if @firstcolumn = true
      then \@tempcnta := -1
    fi
    else if @mparswitch = true
      then if count0 odd
        else \@tempcnta := -1
      fi
    fi
    if @reversemargin = true
      then \@tempcnta := -\@tempcnta
    fi
  fi
  if \@tempcnta < 0 then \box\@marbox :=G \box\@currbox
  fi
  \@tempdima :=L maximum(\@mparbottom - \@pageht
                        + ht of \@marbox, 0)
  if \@tempdima > 0 then LaTeX warning: 'marginpar moved' fi
  \@mparbottom :=G \@pageht + \@tempdima + depth of \@marbox
                + \marginparpush
```

```

\@tempdima :=L \@tempdima - ht of \@marbox
\box\@marbox :=G \box\@currbox
\hbox { \vskip \@tempdima
\box\@marbox
}
height of \@marbox :=G depth of \@marbox :=G 0
\kern -\@pagedp
\nointerlineskip
\hbox{ if @tempcnta > 0 then \hskip \columnwidth
\hskip \marginparsep
else \hskip -\marginparsep
\hskip -\marginparwidth
fi
\box\@marbox \hss
}
\nobreak
\nointerlineskip
\hbox{\vrule height 0 width 0 depth \@pagedp}
END

```

Floats and marginpars add a lot of dead cycles.

83 \newdimen\marginparwidth
84 \newdimen\marginparsep
85 \newdimen\marginparpush

```

`\AtBeginDvi` We use a box register in which to put stuff that must appear before anything else in the `.dvi` file.

`\@begindvibox` The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

86 \newbox\@begindvibox
87 %\DeclareRobustCommand \AtBeginDvi [1]{%
88 % \global \setbox \@begindvibox
89 % \vbox{\unvbox \@begindvibox #1}%
90 %}

```

(End of definition for `\AtBeginDvi` and `\@begindvibox`. These functions are documented on page 1013.)

`\@maxdepth` This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

(End of definition for `\@maxdepth`.)

`\paperheight` New `\paper...` registers.

```

\paperwidth 93 \newdimen\paperheight
94 \newdimen\paperwidth

```

(End of definition for `\paperheight` and `\paperwidth`.)

`\stockheight` New `\stock...` registers.

```

\stockwidth 95 \newdimen\stockheight
96 \newdimen\stockwidth

```

(End of definition for `\stockheight` and `\stockwidth`.)

`\if@insert` Local switches first:

```

\if@fcolmade 97 \newif \if@insert

```

`\if@specialpage` These should definitely be global:

```

\if@firstcolumn 98 \newif \if@fcolmade
\if@twocolumn 99 \newif \if@specialpage \@specialpagefalse
\if@twoside

```

These should be global but are not always set globally in other files.

```

\if@reversemargin 100 \newif \if@firstcolumn \@firstcolumntrue
\if@mparswitch 101 \newif \if@twocolumn \@twocolumnfalse
\col@number

```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```
102 \newif \if@twoside      \@twosidefalse
103 \newif \if@reversemargin \@reversemarginfalse
104 \newif \if@mparswitch  \@mparswitchfalse
```

This counter has been imported from ‘multicol’.

```
105 \newcount \col@number
106 \col@number \@ne
```

(End of definition for \if@insert and others.)

163 \if@inlabel
164 \leavevmode
165 \global \@inlabelfalse
166 \fi
167 \if@nobreak \@nobreakfalse \everypar{}\fi
168 \par

```

The \vfii at the end of the macro before the break penalty will normally result in the page being run short, even with \flushbottom in effect (in contrast to the behavior of \pagebreak). However, if there is some explicit stretch on the page, say, a \vfill, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of \prevdepth is no longer taken into

account by T_EX. So we back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

```

169 \ifdim\prevdepth>\z@
170   \vskip -%
171   \ifdim\prevdepth>\maxdepth
172     \maxdepth
173   \else

194 <latexrelease>  \if@nobreak \@nobreakfalse \everypar{}\fi
195 <latexrelease>  \par
196 <latexrelease>  \vfil
197 <latexrelease>  \penalty -\@M}
198 <latexrelease>\EndIncludeInRelease
199 <*2ekernel | fltrace>

```

(End of definition for \newpage.)

`\@emptycol` It may be better to use an invisible rule rather than an empty box here.

```

200 \def \@emptycol {\vbox{} \penalty -\@M}

```

(End of definition for \@emptycol.)

`\twocolumn` There are several bug fixes to the two-column stuff here.
`\@topnewpage`

```

201 \def \twocolumn {%
202   \clearpage
203   \global\columnwidth\textwidth
204   \global\advance\columnwidth-\columnsep
205   \global\divide\columnwidth\tw@
206   \global\hsize\columnwidth
207   \global\linewidth\columnwidth
208   \global\@twocolumntrue
209   \global\@firstcolumntrue
210   \col@number \tw@

```

There is no reason to put a `\@dblfloatplacement` here since `\@topnewpage` ignores these settings. The `\@floatplacement` is needed in case this comes after some changes.

```
211 \ifnextchar [\@topnewpage\@floatplacement
212 }
```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```
213 \long\def \@topnewpage [#1]{%
214 \nodocument
215 \@next\@currbox\@freelist{}-{}%
216 \global \setbox\@currbox
217 \color@vbox
218 \normalcolor
219 \vbox {%
220 \hsize\textwidth
221 \@parboxrestore
222 \col@number \@ne
223 #1%
224 \vskip -\dbltextfloatsep
225 }%
226 \color@endbox
```

Added size test and warning message; perhaps we should use an error message.

```
227 \ifdim \ht\@currbox>\textheight
228 \ht\@currbox \textheight
229 \fi
```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtodblcol`, plus some extra checks for error trapping.

```
230 \global \count\@currbox \tw@
231 \@tempdima -\ht\@currbox
232 \advance \@tempdima -\dbltextfloatsep
233 \global \advance \@colht \@tempdima
234 \ifx \@dbltoplist \@empty
235 \else
236 \latex@error{Float(s) lost}\@ehb
237 \let \@dbltoplist \@empty
238 \fi
239 \@cons \@dbltoplist \@currbox
```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```
240 \global \@dbltopnum \m@ne
241 \*trace
242 \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
243 \*trace
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there

is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

244 \ifdim \@colht<2.5\baselineskip
245 \latex@warning@no@line {Optional argument of \noexpand\twocolumn
246 too tall on page \thepage}%
247 \@emptycol
248 \if@firstcolumn
249 \else
250 \@emptycol
251 \fi
252 \else
253 \global \vsize \@colht
254 \global \@colroom \@colht
255 \@floatplacement
256 \fi
257 }

```

(End of definition for `\twocolumn` and `\topnewpage`.)

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will
`\@specialoutput` interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

258 \output {%
259 \let \par \@@par
260 \ifnum \outputpenalty<-\@M
261 \@specialoutput
262 \else
263 \@makecol
264 \@opcol

```

Moved to `\@opcol: \@floatplacement`.

```

265 \@startcolumn

```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```

266 \@whilesw \if@fcolmade \fi
267 {%
268 (*trace)
269 \fl@trace{PAGE: float \if@twocolumn column \else page \fi
270 completed}%
271 
```

```

271 
```

```

272 \@opcol\@startcolumn}%
273 \fi
274 \ifnum \outputpenalty>-\@Miv

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\@emptycol` will be executed again when the OR is called by the page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.

```

275     \ifdim \@colroom<1.5\baselineskip
276     \ifdim \@colroom<\textheight
277     \@latex@warning@no@line {Text page \thepage\space
278                             contains only floats}%
279     \@emptycol
280 %     \if@twocolumn
281 %     \if@firstcolumn
282 %     \else
283 %     \@emptycol
284 %     \fi
285 %     \fi
286 \else
287     \global \vsize \@colroom
288 \fi
289 \else
290     \global \vsize \@colroom
291 \fi
292 \else
293     \global \vsize \maxdimen
294 \fi
295 }

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CHANGES TO `\@specialoutput`:

* `\penalty\z@` changed to `\penalty\interlinepenalty` so `\samepage` works properly with figure and table environments.

(Changed 23 Oct 86)

* Definition of `\@specialoutput` changed 26 Feb 88 so `\@pageht` and `\@pagedp` aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

End of historical L^AT_EX 2.09 comments.

```

296 \gdef\@specialoutput{%
297     \ifnum \outputpenalty>-\@Mii
298     \@docclearpage

```

```

299 \else
300   \ifnum \outputpenalty<-\@Miii
301     \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
302     \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
303   \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```

304   \global \setbox\@holdpg \vbox{%
305             \unvbox\@holdpg
306             \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by T_EX.

```

307             \setbox\@tempboxa \lastbox
308             \unskip
309           }%

```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```

310   \@pagedp \dp\@holdpg
311   \@pageht \ht\@holdpg
312   \unvbox \@holdpg
313   \@next\@currbox\@currlist{%
314     \ifnum \count\@currbox>\z@

```

Putting the whole size into `\@pageht` (see above).

```

315     \advance \@pageht \@pagedp
316     \ifvoid\footins \else
317       \advance \@pageht \ht\footins
318       \advance \@pageht \skip\footins
319       \advance \@pageht \dp\footins
320     \fi
321     \ifvbox \@kludgeins

```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```

322     \ifdim \wd\@kludgeins=\z@
323       \advance \@pageht \ht\@kludgeins
324   (*trace)
325     \fl@trace {Extra size added: \the \ht\@kludgeins}%
326   (/trace)
327   \fi
328   \fi

```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```

329         \@reinserts
330         \@addtocurcol
331     \else
332         \@reinserts
333         \@addmarginpar
334     \fi
335 } \latexbug

```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```

336     \ifnum \outputpenalty<\z@
337     \if@nobreak
338         \nobreak
339     \else
340         \addpenalty \interlinepenalty
341     \fi
342 \fi
343 \fi
344 \fi
345 }
346 </2ekernel | fltrace)

```

(End of definition for \output and \@specialoutput.)

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area. (Actually
`\f@depth` the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

347 <latexrelease>\IncludeInRelease{2015/01/01}%
348 <latexrelease>           {\@testwrongwidth}{float order in 2-column}%
349 <*2ekernel | latexrelease | fltrace)

370 <latexrelease>\let\@testwrongwidth\@undefined
371 <latexrelease>\let\f@depth\@undefined
372 <latexrelease>\EndIncludeInRelease

```

(End of definition for \@testwrongwidth and \f@depth.)

`\@docclearpage` This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwrongwidth{<box>}` at suitable places. That is at places where a box is taken off the deferlist.

```

`\@opcol` Several changes in detail here.

```

467 <*2kernel | ftrace>
468 \def \@opcol {%
469   \if@twocolumn

```

The funny-looking internal commands are interfacing with the new marks mechanism. We make sure (elsewhere) that those are always defined, even when we roll back, so here we add them unconditionally. This still need turning into a hook or config point eventually:

```

470   \@expl@@mark@update@dblcol@structures@@
471   \@outputdblcol
472 \else
473   \@expl@@mark@update@singlecol@structures@@
474   \@outputpage
475 <*trace>
476   \fl@trace{PAGE: one column (float? see above) page completed}%
477 </trace>

```

Not needed since it comes after `\@outputpage`:

```

478 %   \global\@colht\textheight
479   \fi

```

These do not need to be done every time `\@opcol` is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

480   \global \@mparbottom \z@ \global \@textfloatsheight \z@
481   \@floatplacement
482 }
483 </2kernel | ftrace>

```

(End of definition for \@opcol.)

`\@makecol` We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```
484 (*2kernel)
485 \gdef \@makecol {%
486   \ifvoid\footins
487     \setbox\@outputbox \box\@cclv
488   \else
489     \setbox\@outputbox \vbox {%
```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```
490   \boxmaxdepth \@maxdepth

491 %   \@tempdima\dp\@cclv
492   \unvbox \@cclv
493 %   \vskip-\@tempdima
494   \vskip \skip\footins

495   \color@begingroup
496     \normalcolor
497     \footnoterule
498     \unvbox \footins
499   \color@endgroup
500 }%
501 \fi
```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```
502 \let\@elt\relax
503 \xdef\@freelist{\@freelist\@midlist}%

504 \global \let \@midlist \@empty
505 \@combinefloats
```

The variations start here in case `\enlargethispage` has been used.

```
506 \ifvbox\@kludgeins
507   \@makespecialcolbox
508 \else
```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\@maxdepth`) the correct value?

The `\vskip -\dimen@` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```
509   \setbox\@outputbox \vbox to\@colht {%
510 %       \boxmaxdepth \maxdepth           %??
511       \@texttop
512       \dimen@ \dp\@outputbox
513       \unvbox \@outputbox
514       \vskip -\dimen@
515       \@textbottom
516   }%
517 \fi
518 \global \maxdepth \@maxdepth
519 }
```

(End of definition for \@makecol.)

`\@reinserts` This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```
520 \gdef \@reinserts{%
521   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
522   \ifvbox\@kludgeins\insert\@kludgeins
523       {\unvbox\@kludgeins}\fi
524 }
525 </2ekernel>
```

(End of definition for \@reinserts.)

`\@makespecialcolbox` This implements certain variations in page-makeup.

```
526 <*2ekernel | fltrace>
527 \gdef \@makespecialcolbox {%
528 <*trace>
529   \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
530             dp \the\dp\@kludgeins\space
531             wd \the\wd\@kludgeins}%
532 </trace>
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```
533 \setbox\@outputbox \vbox {%
534   \@texttop
535   \dimen@ \dp\@outputbox
536   \unvbox\@outputbox
537   \vskip-\dimen@
538 }%
539 \@tempdima \@colht
540 \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the *-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the `TEX` level!).

This needs `TEX3` otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

Their should perhaps be an upper limit, of `0pt?`, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

541     \advance \@tempdima -\ht\@outputbox
542     \advance \@tempdima \pageshrink
543 <*trace>
544     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
545     \fl@trace {\string \@colht: \the \@colht}%
546     \fl@trace {Pageshrink added: \the \pageshrink}%
547     \fl@trace {Hence, space added: \the \@tempdima}%
548 </trace>
549     \setbox\@outputbox \vbox to \@colht {%
550 %       \boxmaxdepth \maxdepth
551       \unvbox\@outputbox
552       \vskip \@tempdima
553       \@textbottom
554     }%
```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

555     \else
556     \advance \@tempdima -\ht\@kludgeins
557 <*trace>
558     \fl@trace {Natural ht of col: \the \ht\@outputbox}%
559     \fl@trace {\string \@colht: \the \@colht}%
560     \fl@trace {Extra size added: -\the \ht \@kludgeins}%
561     \fl@trace {Hence, height of inner box: \the \@tempdima}%
562     \fl@trace {Max? pageshrink available: \the \pageshrink}%
563 </trace>
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

564     \setbox \@outputbox \vbox to \@colht {%
565       \vbox to \@tempdima {%
```

```

566         \unvbox\@outputbox
567         \@textbottom}%
568     \vss}%
569 \fi

```

Finally we need to explicitly make the insert box void.

```

570     {\setbox \@tempboxa \box \@kludgeins}%
571 \<trace)
572     \fl@trace {kludgeins box made void}%
573 \</trace)
574 }
575 \</2kernel | fltrace)

```

(End of definition for \@makespecialcolbox.)

```

\@texttop These do nothing as a default.
\@textbottom
576 \<2kernel)
577 \let \@texttop \relax
578 \let \@textbottom \relax

```

(End of definition for \@texttop and \@textbottom.)

`\@resetactivechars` RmS 93/09/06: added hook to protect against certain active characters in the output routine. Default checks are for active space and end-of-line.

```

\@activechar@info
579 \def\@activechar@info #1{%
580     \@latex@info@no@line {Active #1 character found while
581                             output routine is active
582                             \MessageBreak
583                             This may be a bug in a package file
584                             you are using}%
585 }

```

Do not put any spaces in this next bit!

```

586 \begingroup
587 \obeylines\obeyspaces%
588 \catcode'\active%
589 \gdef\@resetactivechars{%
590 \def^M{\@activechar@info{EOL}\space}%
591 \def {\@activechar@info{space}\space}%
592 \let'\active@math@prime}%
593 \endgroup

```

(End of definition for \@resetactivechars and \@activechar@info.)

`\@outputpage` The `\color@hbox` hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

`\@shipoutsetup` There has been extensive tidying up of the old code here; including the removal of a level of grouping.

`\@writesetup` The setting of `\protect` immediately before the `\shipout` is needed so that protected commands within `\writes` are handled correctly.

Within `shipout's` `vbox` it is reset to its default value, `\relax`.

Resetting it to its default value after the `shipout` has been completed (and the contents of the `writes` have been expanded) must be done by use of `\aftergroup`. This

is because it must have the value `\relax` before macros coming from other uses of `\aftergroup` within this box are expanded.

Putting this into the `\aftergroup` token list does not affect the definition used in expanding the `\writes` because the `aftergroup` token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an `\aftergroup` within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
594 </2ekernel>
595 <latexrelease>\IncludeInRelease{2017/04/15}%
596 <latexrelease> {\@outputpage}{Reset language for hyphenation}%
597 <*2ekernel | latexrelease>
598 \def\@outputpage{%
```

The `\endgroup` is put in by `\aftergroup`.

```
599 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command `\@writesetup`.

```
600 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
601 \language\document@default@language
```

The `\catcode'\ = 10` was removed as it was considered useless (presumably because nothing gets tokenized during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
602 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
603 \global\let\@if@newlist\if@newlist
```

```
604 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyph
```

```
\let\'\@acci\let\'\@accii\let\=\@acciii
```

```
\let\\\@normalcr
```

```
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```

\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy

```

```
605 \@parboxrestore
```

... to here was in the command \@writesetup.

```
606 \shipout \vbox{%
607   \set@typeset@protect
608   \aftergroup \endgroup

```

Correct? or just restore by ending the group?

```
609   \aftergroup \set@typeset@protect

```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \@shipoutsetup.

```
610 \if@specialpage
611   \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
612 \fi
613 \if@twoside
614   \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfont
615     \let\@themargin\oddsidemargin
616   \else \let\@thehead\@evenhead
617     \let\@thefoot\@evenfoot \let\@themargin\evensidemargin
618   \fi
619 \fi

```

The rest was always inside the box.

RmS 91/08/15: added this line:

```
620 \reset@font

```

RmS 93/08/06 Added \lineskiplimit=0pt to guard against it being nonzero: e.g. by \offinterlineskip being in effect.

There are probably lots of other things that may need resetting.

```
621 \normalsize

```

Reset the space factors.

```
622 \normalsfcodes

```

Reset these here (previously reset separately for head and foot)

```
623 \let\label@gobble
624 \let\index@gobble
625 \let\glossary@gobble
626 \baselineskip\z@skip \lineskip\z@skip \lineskiplimit\z@

```

... to here was in the command \@shipoutsetup.

```
627   \@beginndvi
628   \vskip \topmargin
629   \moveright\@themargin \vbox {%

1151 </trace>

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear `\everypar` since the float may not reset the flag and cannot reset the `\everypar` globally.

Typesetting starts here (we are in vertical mode).

```

1152         \if@nobreak
1153         \nobreak
1154         \@nobreakfalse
1155         \everypar{}%
1156     \else
1157         \addpenalty \interlinepenalty
1158     \fi
1159     \vskip \intextsep
1160     \box\@currbox
1161     \penalty\interlinepenalty
1162     \vskip\intextsep
1163     \ifnum\outputpenalty <-\@Mii \vskip -\parskip\fi

```

Typesetting ends here.

```

1164         \outputpenalty \z@
1165         \@inserttrue
1166 <*trace>
1167         \else
1168         \fl@trace{Fail---no room at 2nd test of colroom
1169             (addtocorcol \string\intextsep)}%
1170 </trace>
1171         \fi
1172     \fi
1173     \if@insert
1174     \else

```

Next set of docstrip guards are a bit weird, essentially `\@addtotoporbot` ends up inside the kernel and the `fltrace` package and `\@addtobot` shows up in the `flafter` package. Guess that could have been done a bit more obvious :-)

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1318 <latexrelease | fltrace | flafter> \if@nobreak
1319 <latexrelease | fltrace | flafter> \nobreak
1320 <latexrelease | fltrace | flafter> \@nobreakfalse
1321 <latexrelease | fltrace | flafter> \everypar{}%
1322 <latexrelease | fltrace | flafter> \else
1323 <latexrelease | fltrace | flafter> \addpenalty\interlinepenalty
1324 <latexrelease | fltrace | flafter> \fi
1325 <latexrelease | fltrace | flafter> \vskip \intextsep
1326 <latexrelease | fltrace | flafter> \box\@currbox
1327 <latexrelease | fltrace | flafter> \penalty\interlinepenalty
1328 <latexrelease | fltrace | flafter> \vskip\intextsep
1329 <latexrelease | fltrace | flafter> \ifnum\outputpenalty
1330 <latexrelease | fltrace | flafter> <-\@Mii \vskip
1331 <latexrelease | fltrace | flafter> -\parskip\fi

```

Typesetting ends here.

```

1332 <latexrelease | fltrace | flafter> \outputpenalty \z@
1333 <latexrelease | fltrace | flafter> \@inserttrue
1334 <*trace>
1335 <latexrelease | fltrace | flafter> \else

```

```

1336 <latexrelease | fltrace | flafter> \fl@trace{Fail---no room at 2nd test of colroom
1337 <latexrelease | fltrace | flafter> (addtocorcol \string\intextsep)}%
1338 </trace>
1339 <latexrelease | fltrace | flafter> \fi
1340 <latexrelease | fltrace | flafter> \fi
1341 <latexrelease | fltrace | flafter> \if@insert
1342 <latexrelease | fltrace | flafter> \else

```

Next set of docstrip guards are a bit weird, essentially \@addtotoporbot ends up inside the kernel and the fltrace package and \@addtotoporbot shows up in the flafter package. Guess that could have been done a bit more obvious :-)

\@addmarginpar

```

1815 <*2kernel>
1816 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
1817 \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne
1818 \if@twocolumn
1819 \if@firstcolumn \@tempcnta\m@ne \fi
1820 \else
1821 \if@mparswitch
1822 \ifodd\c@page \else\@tempcnta\m@ne \fi
1823 \fi
1824 \if@reversemargin \@tempcnta -\@tempcnta \fi
1825 \fi
1826 \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1827 \@tempdima\@mparbottom
1828 \advance\@tempdima -\@pageht
1829 \advance\@tempdima\ht\@marbox
1830 \ifdim\@tempdima >\z@
1831 \@latex@warning@no@line {Marginpar on page \thepage\space moved}%
1832 \else
1833 \@tempdima\z@
1834 \fi
1835 \global\@mparbottom\@pageht
1836 \global\advance\@mparbottom\@tempdima
1837 \global\advance\@mparbottom\dp\@marbox
1838 \global\advance\@mparbottom\marginparpush
1839 \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1840 \global\setbox \@marbox
1841 \vbox {\vskip \@tempdima
1842 \box \@marbox}%
1843 \global \ht\@marbox \z@
1844 \global \dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

1845 \kern -\@pagedp
1846 \nointerlineskip
1847 \hb@xt@\columnwidth

```

```

1848     {\ifnum \@tempcnta >\z@
1849       \hskip\columnwidth \hskip\marginparsep
1850       \else
1851         \hskip -\marginparsep \hskip -\marginparwidth
1852       \fi
1853       \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

      \nobreak          %% No longer needed.  CAR92/12
      \vskip -\@tempdima  %% No longer needed.  CAR92/12
1854     \nointerlineskip
1855     \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}

```

(End of definition for \@addmarginpar.)

1.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX₂ε.

`\enlargethispage{<dim>}`

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

`\enlargethispage*{<dim>}`

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```

1856 \newinsert \@kludgeins
1857 \global\dimen\@kludgeins \maxdimen
1858 \global\count\@kludgeins 1000

```

(End of definition for \@kludgeins.)

`\enlargethispage` The user command.

```

\enlargethispage* 1859 \gdef \enlargethispage {%
1860   \@ifstar
1861   {%
1862   \*trace)
1863   \fl@trace{Enlarging page height * }%
1864   \*trace)
1865   \@enlargepage{\hbox{\kern\p@}}}%

```

```

1866     {%
1867 <*trace>
1868     \fl@trace{Enlarging page height exactly---}%
1869 </trace>
1870     \@enlargepage\@empty}%
1871 }

```

(End of definition for \enlargethispage and \enlargethispage*.)

\@enlargepage This actually inserts the insert, after checking for extreme values of the change.

```

1872 \gdef\@enlargepage#1#2{%
1873 <*trace>
1874     \fl@trace{\@spaces\@spaces by #2}%
1875 </trace>
1876     \@tempskipa#2\relax
1877     \ifdim \@tempskipa>.5\maxdimen
1878         \latex@error{Suggested\space extra\space height\space
1879                     (\the\@tempskipa)\space dangerously\space
1880                     large}\@eha
1881     \else
1882         \ifdim \vsize<.5\maxdimen
1883 <*trace>
1884         \fl@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
1885 </trace>
1886         \@bsphack
1887         \insert\@kludgeins{#1\vskip-\@tempskipa}%
1888         \@esphack

```

This next bit is for tracing only:

```

1889 <*trace>
1890     \ifvmode \par
1891         \fl@trace {Kludgeins added--pagegoal after: \the \pagegoal}%
1892     \fi
1893 </trace>
1894     \else
1895         \latex@error{Page\space height\space already\space
1896                     too\space large}\@eha
1897     \fi
1898     \fi
1899 }

```

(End of definition for \@enlargepage.)

\ShowFloat This command provides some information about the contents of a float register. Float registers have internal names of the form `\bx@{Uppercase-letter(s)-or numbers}` and you specify just this letter or letters as the argument, e.g., `\ShowFloat{A}`. (There is not much error recovery if you specify something that isn't a float.)

```

1900 </2ekernel>
1901 <*2ekernel | latexrelease>
1902 <latexrelease>\IncludeInRelease{2021/11/15}%
1903 <latexrelease>           {\ShowFloat}{Show float register contents}%
1904 \def\ShowFloat#1{\begingroup
1905     \let \fl@trace \fl@tracemessage
1906     \fl@trace{***Float #1 details:}%
1907     \ifcsname bx@#1\endcsname

```

```

1908     \expandafter\fl@ShowFloat\csname bx@#1\endcsname
1909     \else
1910       \fl@trace{Not a float!}%
1911     \fi
1912   \endgroup
1913 }
1914 \def\fl@ShowFloat#1{%
1915   \fl@traceval{\count#1}% % this here should be interpreted on day
1916   \fl@traceval{\ht#1}%

1918   \fl@traceval{\wd#1}%
1919   {\tracingonline1\showboxbreadth10\showboxdepth3\showbox#1}%
1920 }

```

Here are two definitions from `fltrace` that make the above code work:

```

1921 \def \fl@traceval #1{\fl@trace{\string #1 = \the #1}}
1922 \def \fl@tracemessage #1{\let\@elt\@empty\typeout{LaTeX2e: #1}}
1923 </2kernel | latexrelease>
1924 <latexrelease>\EndIncludeInRelease
1925 <latexrelease>\IncludeInRelease{0000/00/00}%
1926 <latexrelease>           {\ShowFloat}{Show float register contents}%
1927 <latexrelease>
1928 <latexrelease>\let\ShowFloat\@undefined
1929 <latexrelease>\let\fl@ShowFloat\@undefined
1930 <latexrelease>\let\fl@traceval\@undefined
1931 <latexrelease>\let\fl@tracemessage\@undefined
1932 <latexrelease>\EndIncludeInRelease

```

(End of definition for \ShowFloat.)

1.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in `LATEX2e`.

```
\suppressfloats
```

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

`[t]` suppresses only floats at the top of the page `[b]` suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, `!`, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```
\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\tracefloatsoff is no tracing.
\tracefloats 1933 <*\fltrace>
\fl@traceval 1934 \def \fl@tracemessage #1{\let\@elt\@empty\typeout{LaTeX2e: #1}}

1992 \fl@trace{dbldeferlist: \@dbldeferlist}%
1993 \endgroup
1994 }
1995 \EndIncludeInRelease

```

We need to make sure that `fltrace` comes before `flafter` to make the tracing work.

```

1996 \@ifpackageloaded{flafter}
1997 {\PackageWarningNoLine
1998   {fltrace}{Load 'fltrace' before 'flafter'\MessageBreak
1999   Attempting to recover by reloading 'flafter'}}%
Hide the fact that flafter was already loaded and then request it anew.
2000 \expandafter\let\csname ver@flafter.sty\endcsname\relax
2001 \def\reserved@a#1{%
2002   \expandafter\let\csname string#1+flafter+IIR\endcsname\relax}%
2003 \reserved@a\@addtocurcol
2004 \reserved@a\@addtonextcol
2005 \RequirePackage{flafter}}{}
2006 </fltrace>

```

As the code for `flafter` will contain tracing calls so that it works in conjunction with `fltrace` we need to provide a dummy definition for `\fl@trace` in that package.

```

2007 <flafter>
2008 \providecommand\fl@trace[1]{}
2009 </flafter>

```

(End of definition for \fl@trace and others.)

`\suppressfloats` Float suppression commands: these set the relevant counter globally to zero. Thus they are overridden for a particular float by an `!` specifier.

```

2010 <*2kernel>
2011 \def \suppressfloats {%
2012   \@ifnextchar [%

```

```

2013     \@flstop
2014     {\global \@colnum \z@}%
2015 }

```

Maybe this should be a loop over #1?

```

2016 \def \@flstop [#1]{%
2017     \if t#1%
2018         \global \@topnum \z@
2019     \fi
2020     \if b#1%
2021         \global \@botnum \z@
2022     \fi
2023 }

```

(End of definition for \suppressfloats and \@flstop.)

Manipulation of float placement and type; both their strings and the corresponding count registers.

`\@fpstype`
`\@reqcolroom`
`\@textfloatsheight`

First a new count register to go with `\@currtype`.

Then a new skip register, for information needed to remove the `\@maxsep` conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of `\@addtocurcol` which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

2024 \newcount \@fpstype
2025 \newdimen \@reqcolroom
2026 \newdimen \@textfloatsheight
2027 \l2kernel

```

(End of definition for \@fpstype, \@reqcolroom, and \@textfloatsheight.)

`\@fpsaddddefault`

Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

def \@fpsaddddefault {%
    \@temptokena \expandafter\expandafter\expandafter
                {\csname fps@\@capytype \endcsname}%
    \edef \reserved@a {\the\@temptokena}%
    \@onelevel@sanitize \reserved@a
    \edef \@fps {\@fps\reserved@a}%
}

```

```

2028 \l2kernel | ftrace)
2029 \def \@fpsaddddefault {%
2030 \l2trace)
2031     \fl@trace{fps changed from: \@fps}%
2032 \l2trace)
2033     \edef \@fps {\@fps\csname fps@\@capytype \endcsname}%
2034     \@latex@warning {%
2035         No positions in optional float specifier.\MessageBreak
2036         Default added (so using '\@fps')}%
2037 }

```

(End of definition for \@fpsaddddefault.)

`\@setfloattypescounts` Sets counters `\@fpstype` and `\@currtype`.
 BANG == bit4 of `\count\@currbox` = 0.

```

2038 \def \@setfloattypescounts {%
2039   \@currtype \count\@currbox
2040   \@fpstype \count\@currbox
2041   \divide\@currtype\@xxxii \multiply\@currtype\@xxxii
2042   \advance \@fpstype -\@currtype
2043 }*trace)

2106 \fi
2107 }

```

(End of definition for \@resethfps.)

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the 'bang float') with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist.

Almost identical considerations pertain to `\@addtodblcol`. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2108 \def \@flsetnum #1{%
2109 <*trace>
2110   \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%
2111 </trace>
2112   \ifnum \@fpstype<\sist@n

(End of definition for `\@flupdates`.)

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: dbl not needed, ord needed.
3. `\floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just h or !h should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an h float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice `\intertextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The ! option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?

15. There are four possibilities for supporting this:

```
\twocolumn[\maketitle more text]
```

One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user's viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.

16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to `0pt`?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
- It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height `0pt`.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.
- It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%  
  % Why is this done first?  
  \global \@mparbottom \z@  
  \if@twocolumn
```

```

\@outputdblcol
\else
\@outputpage
% This is not needed since it is done at the end of
% |\@outputpage|:
\global \@colht \textheight
\fi}

```

Only tracing has been added to these.

```

1.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

- \c@topnumber** This counter holds the maximum number of floats that can appear at the top of a text page or column.
- ```

2326 <*2ekernel>
2327 \newcount\c@topnumber
2328 \setcounter{topnumber}{2}

```
- (End of definition for \c@topnumber.)*
- \topfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.
- ```

2329 \newcommand\topfraction{.7}

```
- (End of definition for \topfraction.)*
- \c@bottomnumber** This counter holds the maximum number of floats that can appear at the bottom of a text page or column.
- ```

2330 \newcount\c@bottomnumber
2331 \setcounter{bottomnumber}{1}

```
- (End of definition for \c@bottomnumber.)*
- \bottomfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.
- ```

2332 \newcommand\bottomfraction{.3}

```
- (End of definition for \bottomfraction.)*
- \c@totalnumber** This counter holds the maximum number of floats that can appear on any text page or column.
- ```

2333 \newcount\c@totalnumber
2334 \setcounter{totalnumber}{3}

```
- (End of definition for \c@totalnumber.)*

`\textfraction` This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

```
2335 \newcommand\textfraction{.2}
```

*(End of definition for \textfraction.)*

`\floatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

```
2336 \newcommand\floatpagefraction{.5}
```

*(End of definition for \floatpagefraction.)*

`\c@dbltopnumber` This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

```
2337 \newcount\c@dbltopnumber
2338 \setcounter{dbltopnumber}{2}
```

*(End of definition for \c@dbltopnumber.)*

`\dbltopfraction` This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

```
2339 \newcommand\dbltopfraction{.7}
```

*(End of definition for \dbltopfraction.)*

`\dblfloatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

```
2340 \newcommand\dblfloatpagefraction{.5}
```

*(End of definition for \dblfloatpagefraction.)*

### Floats on a text page

`\floatsep`  
`\textfloatsep`  
`\intextsep`

When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

```
2341 \newskip\floatsep
2342 \newskip\textfloatsep
2343 \newskip\intextsep
2344 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2345 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
2346 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

*(End of definition for \floatsep, \textfloatsep, and \intextsep.)*

`\dblfloatsep` `\dbltextfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
2347 \newskip\dblfloatsep
2348 \newskip\dbltextfloatsep
2349 \setlength\dblfloatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2350 \setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

*(End of definition for `\dblfloatsep` and `\dbltextfloatsep`.)*

### Floats on their own page or column

`\@fptop` `\@fpsep` `\@fpbot` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ...fil` so as to fill the remaining empty space.

```
2351 \newskip\@fptop
2352 \newskip\@fpsep
2353 \newskip\@fpbot
2354 \setlength\@fptop{0\p@ \@plus 1fil}
2355 \setlength\@fpsep{8\p@ \@plus 2fil}
2356 \setlength\@fpbot{0\p@ \@plus 1fil}
```

*(End of definition for `\@fptop`, `\@fpsep`, and `\@fpbot`.)*

`\@dblfpptop` Double-column ‘float pages’ in two-column mode use similar parameters.

```
\@dblfpsep 2357 \newskip\@dblfpptop
\@dblfpbot 2358 \newskip\@dblfpsep
2359 \newskip\@dblfpbot
2360 \setlength\@dblfpptop{0\p@ \@plus 1fil}
2361 \setlength\@dblfpsep{8\p@ \@plus 2fil}
2362 \setlength\@dblfpbot{0\p@ \@plus 1fil}
```

*(End of definition for `\@dblfpptop`, `\@dblfpsep`, and `\@dblfpbot`.)*

`\topfigrule` `\botfigrule` `\dblfigrule` The macros can be used to put in rules between floats and text; whatever they insert should be vertical mode material which takes up zero space.

```
2363 \let\topfigrule=\relax
2364 \let\botfigrule=\relax
2365 \let\dblfigrule=\relax
2366 /2kernel)
```

*(End of definition for `\topfigrule`, `\botfigrule`, and `\dblfigrule`.)*

# File 54

## ltagging.dtx

### 1

1 <\*2kernel | latexrelease>  
2 \ExplSyntaxOn

### 2 General support for tagged output

\SuspendTagging  
\ResumeTagging

The are places in code where it is import top stop any tagging activities, e.g., when we are doing trial typesetting that it is done several times. In such a case one must tag only the final version that is actually used, otherwise tagging structures are allowed which then do not end up in the PDF and confuse the mechanism. For this we have two commands that can be used in packages: `\SuspendTagging` and `\ResumeTagging`. They are available as part of the L<sup>A</sup>T<sub>E</sub>X kernel, so that they can be safely used in packages whether or not tagging is requested .They both take string argument that is used for debugging to easily identify why tagging was suspended or restarted, for example, in `tabularx` you find `\SuspendTagging{tabularx}`. By default they two commands do nothing.

TODO: the corresponding L3 layer commands should also have a dummy definition in the kernel!

\UseTaggingSocket  
\tag\_socket\_use:n  
\tag\_socket\_use:nn

To support tagging in packages we use sockets with names starting with `tagsupport/`. Usually, these sockets have exactly two plugs defined: `noop` (when no tagging is requested or tagging is not wanted for some reason) and a second plug that enables the tagging. There may be more, e.g., tagging with special debugging, etc., but right now it is usually just on or off.

Given that we sometimes have to suspend tagging, it would be fairly inefficient to put different plugs into these sockets whenever that happens. We therefore offer `\UseTaggingSocket` which is like `\UseSocket` except that the socket name is specified without `tagsupport/`, i.e.,

`\UseTaggingSocket{foo} → \UseSocket{tagsupport/foo}`

Beside being slightly shorter, the big advantage is that this way we can change `\UseTaggingSocket` to do nothing when tagging is suspended with `\SuspendTagging` instead of changing the plugs of the tagging support sockets back and forth.

It is possible to use the tagging support sockets with `\UseSocket` directly, but in this case the socket remains active if `\SuspendTagging` is in force. There my be reasons for doing that but in general we expect to always use `\UseTaggingSocket`.

The L3 programming layer versions `\tag_socket_use:n` and `\tag_socket_use:nn` are slightly more efficient than `\UseTaggingSocket` because they do not have to determine how many arguments the socket takes when disabling it, so in code that is using the L3 programming layer we recommend to use them instead of the `CamelCase` command.

\SuspendTagging  
\ResumeTagging

In the kernel, these two commands get dummy definitions so that they can be used without harm in packages. The real definition is used when tagging gets enabled.

3 \cs\_new\_eq:NN \SuspendTagging \use\_none:n  
4 \cs\_new\_eq:NN \ResumeTagging \use\_none:n

A simplified version of this definition should move to `tagpdf` and dropped here, eventually.

```

5 \AddToHook{begindocument/before}{
6 \cs_if_exist:NT \tag_stop:n
7 {
8 \cs_set:Npn \SuspendTagging #1 {

```

This stops tagging and also disables all tagging sockets so we are done.

```

9 \tag_stop:n {#1}
10 }
11 \cs_set:Npn \ResumeTagging #1 { \tag_start:n {#1} }
12 }
13 }

```

*(End of definition for \SuspendTagging and \ResumeTagging.)*

`\tag_socket_use:n` Again this is not the final definition for the kernel; it is just a version to get going while  
`\tag_socket_use:nn` some parts of the kernel support are still missing.

```

\UseTaggingSocket
14 \AddToHook{begindocument}[kernel]{
15 \cs_if_exist:NF \tag_if_active:T
16 {
17 \prg_new_conditional:Npnn \tag_if_active: { p , T , TF, F }
18 { \prg_return_false: }
19 }
20 }

```

Dummy definitions in the kernel. These definitions will get updated in `tagpdf`.

```

21 \cs_new_protected:Npn \tag_socket_use:n #1 { }
22 \cs_new_protected:Npn \tag_socket_use:nn #1#2 { }

```

The default in the kernel is just to get rid of the argument:

```

23 \cs_new_protected:Npn \UseTaggingSocket #1 {
24 \int_case:nnF
25 { \int_use:c { c__socket_tagsupport/#1_args_int } }
26 {
27 0 \prg_do_nothing:
28 1 \use_none:n
29 2 \use_none:nn

```

We do not expect tagging sockets with more than one or two arguments, so for now we only provide those.

```

30 }
31 \ERRORusetaggingsocket % that should get a proper error message
32 }
33 \ExplSyntaxOff

```

*(End of definition for \tag\_socket\_use:n, \tag\_socket\_use:nn, and \UseTaggingSocket.)*

## 2.1 Tagging support for table/tabular packages

The code uses a number of sockets to inject the tagging commands. These can be easily set to a noop-plug in case the automated tagging is not wanted.

`tagsupport/tbl/cell/begin (socket)` At first sockets for the begin and end of cells and table rows:

```
tagsupport/tbl/cell/end (socket) 34 \NewSocket{tagsupport/tbl/cell/begin}{0}
tagsupport/tbl/pcell/end (socket) 35 \NewSocket{tagsupport/tbl/cell/end}{0}
tagsupport/tbl/pcell/end (socket) 36 \NewSocket{tagsupport/tbl/row/begin}{0}
tagsupport/tbl/row/begin (socket) 37 \NewSocket{tagsupport/tbl/row/end}{0}
tagsupport/tbl/row/end (socket)
```

Multi-line cells have their own sockets (as they start out in vertical mode and need different treatment).

```
38 \NewSocket{tagsupport/tbl/pcell/begin}{0}
39 \NewSocket{tagsupport/tbl/pcell/end}{0}
```

`tagsupport/tbl/init (socket)` This socket should be at the begin of the table, inside a group. It is used for settings such as disabling para-tagging inside the table. This socket can perhaps be merged later into the begin-sockets.

```
40 \NewSocket{tagsupport/tbl/init}{0}
```

`tagsupport/tbl/finalize (socket)` To fine tune the structure (change cells to header cells, remove unwanted structures, move a foot to the end, etc.). We also need a socket that is executed at the end of the table but *before* all the variables are restored to the outer or default values. The code in the socket can make assignments, but probably shouldn't do typesetting and not write whatsits.

```
41 \NewSocket{tagsupport/tbl/finalize}{0}
```

`tagsupport/tbl/colspan (socket)` This socket is used to manage spanning cells, e.g., a `\multicolumn`. It expects one argument (the number of cells spanned) and if tagging is enabled set appropriate tag attributes in the background. We probably need a similar socket for row spans eventually.

```
42 \NewSocket{tagsupport/tbl/colspan}{1}
```

`tagsupport/tbl/hmode/begin (socket)` These sockets are used in the begin and end code of environments, to allow a fast enabling and disabling of the tagging. We distinguish between tables that can be used inside paragraphs and standalone tables such as `longtable` that are always in vertical mode.

```
tagsupport/tbl/hmode/end (socket)
tagsupport/tbl/vmode/begin (socket)
tagsupport/tbl/vmode/end (socket) 43 \NewSocket{tagsupport/tbl/hmode/begin}{0}
44 \NewSocket{tagsupport/tbl/hmode/end}{0}
45 \NewSocket{tagsupport/tbl/vmode/begin}{0}
46 \NewSocket{tagsupport/tbl/vmode/end}{0}
```

`tagsupport/tbl/longtable/init (socket)` `longtable` needs its own sockets to fine tune the structure. Simply switching the plug in the previous socket interferes with enabling/disabling the tagging.

```
tagsupport/tbl/longtable/finalize (socket)
47 \NewSocket{tagsupport/tbl/longtable/init}{0}
48 \NewSocket{tagsupport/tbl/longtable/finalize}{0}
```

`tagsupport/tbl/longtable/head (socket)` Header and footer boxes need special handling because they are repeatedly used.

```
tagsupport/tbl/longtable/foot (socket) 49 \NewSocket{tagsupport/tbl/longtable/head}{0}
50 \NewSocket{tagsupport/tbl/longtable/foot}{0}
```

### 3 For lttab.dtx parked here for now

```
51 <@=tbl>
52 \ExplSyntaxOn
```

#### 3.1 Variables for row, column and span counting

This part needs a decision on names for various integer registers as well as a decision if those should be also made available for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>-style packages in form of 2e names and or as non-internals for the L3 programming layer.

At the moment they are all internal but this probably has to change.

```
\g__tbl_col_int \g__tbl_row_int holds the current row number in the table. The value 0 means we
\g__tbl_row_int haven't yet processed the table preamble (or in case of longtable are just in front of the
\g__tbl_span_tl next chunk to be processed). It is incremented by every \cr including the one ending
\g__tbl_table_cols_tl the table preamble.
```

TODO: due to the gymnastics needed inside the longtable code the row counter is directly exposed there rather than hidden by interfaces. This needs changing when it is decided how to manage these counters.

`\g__tbl_col_int` holds the current column number. The value 0 means we have not yet started the table or just finished a table row (with `\` typically); any other positive value means we are currently typesetting a cell in that column in some row (denoted by the `\g__tbl_row_int`).

In a `\multicolumn` it holds the column number of the first spanned column and `\g__tbl_span_tl` the info how many cells are spanned.

`\g__tbl_span_tl` is normally 1 except in a `\multicolumn` cell.

```
53 \int_new:N \g__tbl_col_int
54 \int_new:N \g__tbl_row_int
55 \tl_new:N \g__tbl_span_tl
56 \tl_new:N \g__tbl_table_cols_tl
57
58 \tl_gset:Nn \g__tbl_span_tl {1}
59 \tl_gset:Nn \g__tbl_table_cols_tl {0} % indicates outer level
```

*(End of definition for `\g__tbl_col_int` and others.)*

```
\l__tbl_saved_col_tl Saving the outer values if we are nesting tables is necessary (as the above variables are
\l__tbl_saved_row_tl globally altered). For this we always use token lists because they don't change and we
\l__tbl_saved_span_tl do not need to blow additional integer registers.
```

```
\l__tbl_saved_table_cols_tl
60 \tl_new:N \l__tbl_saved_col_tl
61 \tl_new:N \l__tbl_saved_row_tl
62 \tl_new:N \l__tbl_saved_span_tl
63 \tl_new:N \l__tbl_saved_table_cols_tl
64
65 \tl_set:Nn \l__tbl_saved_col_tl{0}
66 \tl_set:Nn \l__tbl_saved_row_tl{0}
67 \tl_set:Nn \l__tbl_saved_span_tl{1}
68 \tl_set:Nn \l__tbl_saved_table_cols_tl{0} % indicates outer level
```

*(End of definition for `\l__tbl_saved_col_tl` and others.)*

```
\g__tbl_missingcells_int This will contain the number of missing cells in a row:
```

```
69 \int_new:N \g__tbl_missing_cells_int
```

*(End of definition for `\g__tbl_missingcells_int`.)*

## 3.2 Tracing/debugging

```
\DebugTablesOn
\DebugTablesOff
70 \def\DebugTablesOn{
71 \cs_set_eq:NN __tbl_trace:n \typeout
72 }
73 \def\DebugTablesOff{
74 \cs_set_eq:NN __tbl_trace:n \use_none:n
75 }
76 \cs_new_eq:NN __tbl_trace:n \use_none:n
```

(End of definition for `\DebugTablesOn` and `\DebugTablesOff`.)

## 3.3 Interface commands

All interface commands for the cell number determination have to be public on some level because they are needed in other packages as well, e.g., `longtable`. We may or may not also want to provide 2e style names for them.

`\tbl_update_cell_data:` Updating cell data in columns after the first means we have to increment the `\g__tbl_col_int` by the span count of the previous cell (in case it was a `\multicolumn`) and then reset the `\g__tbl_span_tl` to one (as the default).

```
77 \cs_new_protected:Npn \tbl_update_cell_data: {
78 \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
79 \tl_gset:Nn \g__tbl_span_tl {1}
80 }
```

(End of definition for `\tbl_update_cell_data:`.)

`\tbl_count_table_cols:` Current implementation of `\@mkpream` uses the scratch counter `\count@` to keep track of the number of toks registers it needs (2 per column), but this can't be used as it counts also insertions made with `!{}` and `@{}`. So similar as does `longtable` for `\LT@cols` we count the numbers of ampersands instead.

```
81 \cs_new:Npn \tbl_count_table_cols: {
82 \seq_set_split:NnV\l__tbl_tmpa_seq {&}\@preamble
83 \tl_gset:Ne \g__tbl_table_cols_tl { \seq_count:N \l__tbl_tmpa_seq }
84 __tbl_trace:n { ==>~ Table~ has~ \g__tbl_table_cols_tl \space columns }
85 }
```

(End of definition for `\tbl_count_table_cols:`.)

`\l__tbl_tmpa_seq`

```
86 \seq_new:N \l__tbl_tmpa_seq
```

(End of definition for `\l__tbl_tmpa_seq`.)

`\tbl_count_missing_cells:n` We might have the situation that some table package has not implemented the `\tbl_count_table_cols:` in which case `\g__tbl_table_cols_tl` would always be zero and we would get an error below when we try to determine the missing cells, so bypass that calculation if we aren't doing tagging (there the packages should have the proper code added). Recall that this is code, that is called by `\` and an old table packagee might rely on whatever the L<sup>A</sup>T<sub>E</sub>X kernel offers here.

```
87 \cs_new:Npn \tbl_count_missing_cells:n #1 {
```

```

88 \tag_if_active:T {
89 \int_compare:nNnT \g__tbl_col_int > 0
90 {
91 \int_gset:Nn \g__tbl_missing_cells_int
92 {
93 \g__tbl_table_cols_tl
94 - \g__tbl_col_int
95 - \g__tbl_span_tl
96 + 1
97 }
98 \int_compare:nNnT \g__tbl_missing_cells_int < 0 \ERRORmissingcells % should not happen
99 __tbl_trace:n{==>~
100 (#1)~
101 This~ row~ needs~
102 \int_use:N \g__tbl_missing_cells_int \space
103 additional~ cell(s)
104 }
105 }
106 }
107 }

```

(End of definition for \tbl\_count\_missing\_cells:n.)

\tbl\_save\_outer\_table\_cols:

```

108 \cs_new_protected:Npn \tbl_save_outer_table_cols: {
109 \tl_set_eq:NN \l__tbl_saved_table_cols_tl \g__tbl_table_cols_tl
110 }

```

(End of definition for \tbl\_save\_outer\_table\_cols:.)

\tbl\_init\_cell\_data\_for\_table:

```

111 \cs_new_protected:Npn \tbl_init_cell_data_for_table: {
112 \tl_set:No \l__tbl_saved_col_tl {\int_use:N \g__tbl_col_int }
113 \tl_set:No \l__tbl_saved_row_tl {\int_use:N \g__tbl_row_int }
114 \tl_set_eq:NN \l__tbl_saved_span_tl \g__tbl_span_tl
115 %
116 __tbl_trace:n { ==>~ saved-cell-data:~
117 \l__tbl_saved_row_tl,
118 \l__tbl_saved_col_tl,
119 \l__tbl_saved_span_tl \space
120 (
121 \int_compare:nNnTF \l__tbl_saved_table_cols_tl = 0
122 { outer~ level }
123 { max:~ \l__tbl_saved_table_cols_tl }
124)
125 }

```

These are the initial values when starting a table:

```

126 \int_gzero:N \g__tbl_row_int
127 \int_gzero:N \g__tbl_col_int
128 \tl_gset:Nn \g__tbl_span_tl {1}
129 }

```

(End of definition for \tbl\_init\_cell\_data\_for\_table:.)

`\tbl_update_cell_data_for_next_row:`

```
130 \cs_new_protected:Npn \tbl_update_cell_data_for_next_row: {
131 \int_gincr:N \g__tbl_row_int % this row about to start
132 \int_gzero:N \g__tbl_col_int % we are before first col
133 }
```

*(End of definition for `\tbl_update_cell_data_for_next_row:.`*)

`\tbl_init_cell_data_for_row:` If we start processing a cell in the first column we set `\g__tbl_col_int` to 1 as we are no longer "at" but "in" the first column. We also set `\g__tbl_span_tl` to its default value (not spanning cells).

```
134 \cs_new_protected:Npn \tbl_init_cell_data_for_row: {
135 \int_gset:Nn \g__tbl_col_int {1}
136 \tl_gset:Nn \g__tbl_span_tl {1}
137 }
```

*(End of definition for `\tbl_init_cell_data_for_row:.`*)

`\tbl_if_row_was_started:T` We use `\g__tbl_col_int` equal zero to indicate that we are just after a TR (i.e. between rows or at the very beginning of the table). Using the row count is not so good as longtable may split the table in chunks.

These conditionals have to be expandable (i.e., unprotected) as they are sometimes executed when  $\TeX$  is scanning inside a table.

```
138 \cs_new:Npn \tbl_if_row_was_started:T {
139 \int_compare:nNnT \g__tbl_col_int > 0
140 }
141 \cs_new:Npn \tbl_if_row_was_started:TF {
142 \int_compare:nNnTF \g__tbl_col_int > 0
143 }
```

*(End of definition for `\tbl_if_row_was_started:T` and `\tbl_if_row_was_started:TF.`*)

`\tbl_gzero_row_count:` This here is basically a temporary interface. What it will be in the end depends on what we decide concerning exposing row and column counters, if they stay internal we need something like this here (perhaps using `gincr` etc, or perhaps some other names in the first place).

```
144 \cs_new_protected:Npn \tbl_gzero_row_count: {
145 \int_gzero:N \g__tbl_row_int
146 }
147 \cs_new_protected:Npn \tbl_gincr_row_count: {
148 \int_gincr:N \g__tbl_row_int
149 }
150 \cs_new_protected:Npn \tbl_gdecr_row_count: {
151 \int_gdecr:N \g__tbl_row_int
152 }
```

*(End of definition for `\tbl_gzero_row_count:.`, `\tbl_gincr_row_count:.`, and `\tbl_gdecr_row_count:.`)*

`\tbl_inbetween_rows:` Again name is not really brilliant so far.

```
153 \cs_new_protected:Npn \tbl_inbetween_rows: {
154 \int_gzero:N \g__tbl_col_int
155 }
```

*(End of definition for `\tbl_inbetween_rows:.`*)

`\tbl_restore_outer_cell_data:`

```
156 \cs_new_protected:Npn \tbl_restore_outer_cell_data: {
157 \int_gset:Nn \g__tbl_col_int { \l__tbl_saved_col_tl }
158 \int_gset:Nn \g__tbl_row_int { \l__tbl_saved_row_tl }
159 \tl_gset_eq:NN \g__tbl_span_tl \l__tbl_saved_span_tl
160 \tl_gset_eq:NN \g__tbl_table_cols_tl \l__tbl_saved_table_cols_tl
161 __tbl_trace:n { ==>~ restored~cell~data:~
162 \int_use:N \g__tbl_row_int,
163 \int_use:N \g__tbl_col_int,
164 \l__tbl_saved_span_tl \space
165 (
166 \int_compare:nNnTF \g__tbl_table_cols_tl = 0
167 { outer~ level }
168 { max:~ \g__tbl_table_cols_tl }
169)
170 }
171 }
```

*(End of definition for \tbl\_restore\_outer\_cell\_data:.)*

`\tbl_update_multicolumn_cell_data:n`

This macro updates `\g__tbl_col_int` and `\g__tbl_span_tl` inside a `\multicolumn` and possibly calls the tagging socket `tbl/row/begin`.

```
172 \cs_new_protected:Npn \tbl_update_multicolumn_cell_data:n #1 {
```

We execute socket for tagging only if this `\multicolumn` replaces the preamble of the first column. In that case we also have to set `\g__tbl_col_int` to 1 because this is no longer done in the preamble for the cell either.

```
173 \int_compare:nNnTF \g__tbl_col_int = 0
174 {
175 \UseTaggingSocket{tbl/row/begin}
176 \int_gset:Nn \g__tbl_col_int {1}
177 }
```

If we are in a later column we use `\g__tbl_span_tl` from the previous column to update.

```
178 {
179 \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
180 }
```

Then we set the span value so that it can be use in the next column.

```
181 \tl_gset:Nn \g__tbl_span_tl {#1}
182 }
```

*(End of definition for \tbl\_update\_multicolumn\_cell\_data:n.)*

`\tbl_crcrcr:n`

This macro is used instead of the usual `\crcrcr` at the end of a table. It is deliberately defined without protection because it may get expanded by the scanning mechanism of low-level T<sub>E</sub>X after a final `\cr` (aka `\`) in the table. In that case it shouldn't stop the expansion and the conditional inside will be false, thus it just vanishes without doing anything. If there are missing cells (in which case we also haven't see `\cr` yet) the macro `\tbl_count_missing_cells:n` is executed and then the row is finished with a final `\cr`.

```
183 \cs_new:Npn \tbl_crcrcr:n #1 {
184 \int_compare:nNnT \g__tbl_col_int > 0
185 {
186 \tbl_count_missing_cells:n {#1}
187 }
```

Even if we are at the start of a row we may have to do a `\cr`, so we do a `\crr` always at the end.

```
188 \crr
189 }
```

*(End of definition for \tbl\_crr:n.)*

```
190 \ExplSyntaxOff
191 <@@=>
```

This is needed for `longtable` because `\refstepcounter` is setting up a target when `hyperref` is loaded and we don't want that in `longtable`.

TODO: move to right .dtx file

```
192 \let\@kernel@refstepcounter\refstepcounter
```

Prevent `longtable` patching by `hyperref` until `hyperref` does so automatically:

```
193 \def\hyper@nopatch@longtable{}
 Should there be a module?

194 <latexrelease>\NewModuleRelease{2024/06/01}{ltagging}
195 <latexrelease> {Tagging support}

196 <latexrelease>\IncludeInRelease{0000/00/00}{ltagging}%
197 <latexrelease> {Undo tagging support}
198 <latexrelease>
199 <latexrelease>
200 <latexrelease>
201 <latexrelease>\EndModuleRelease

202 </2kernel | latexrelease>
```

## File 55

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into L<sup>A</sup>T<sub>E</sub>X. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L<sup>A</sup>T<sub>E</sub>X system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T<sub>E</sub>X's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9 {\message{Loading hyphenation patterns for US english.}%
10 \language=0
11 \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking `\@@end` (which is the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> name for T<sub>E</sub>X's `\end` primitive).

```
12 {\errhelp{The configuration for hyphenation is incorrectly
13 installed.^^J%
14 If you don't understand this error message you need
15 to seek^^Jexpert advice.}%
16 \errmessage{OOPS! I can't find any hyphenation patterns for
17 US english.^^J \space Think of getting some or the
18 latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

## File 56

# ltxfinal.dtx

## 1 Final settings

This section contains the final settings for L<sup>A</sup>T<sub>E</sub>X. It initializes some debugging and typesetting parameters, sets the default `\catcodes` and `uc/lc` codes, and inputs the hyphenation file.

### 1.1 Debugging

By default, L<sup>A</sup>T<sub>E</sub>X shows statistics:

```
1 <*2ekernel>
2 \tracingstats1
```

### 1.2 Typesetting parameters

```
\@lowpenalty These are penalties used internally.
\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty
```

*(End of definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)*

```
\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to
increase compatibility with count allocations in earlier releases.
```

```
6 </2ekernel>
7 <*2ekernel | latexrelease>
8 <latexrelease>\IncludeInRelease{2015/01/01}%
9 <latexrelease> {\newmarks}{Extended Allocation}%
10 \ifx\marks\@undefined\else
11 \def\newmarks{%
12 \e@alloc\marks \e@alloc@chardef{\count256}\m@ne\e@alloc@top}
13 \fi
14 </2ekernel | latexrelease>
15 <latexrelease>\EndIncludeInRelease
16 <latexrelease>\IncludeInRelease{0000/00/00}%
17 <latexrelease> {\newmarks}{Extended Allocation}%
18 <latexrelease>\let\newmarks\@undefined
19 <latexrelease>\EndIncludeInRelease
20 <*2ekernel>
```

*(End of definition for \newmarks.)*

Allocate 3 mark classes to be used in `\markboth` and `\markright`. Should be done earlier but for that definition of `\newmarks` needs moving (which it should I guess).

```
21 </2ekernel>
22 <*2ekernel | latexrelease>
23 <latexrelease>\IncludeInRelease{2022/06/01}%
24 <latexrelease> {2e-left}{Delayed legacy marks}%
25 \NewMarkClass {2e-left}
```

```

26 \NewMarkClass {2e-right}
27 \NewMarkClass {2e-right-nonempty}

```

No rollback really, the marks will remain.

```

28 </2ekernel | latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <latexrelease>\IncludeInRelease{0000/00/00}%
31 <latexrelease> {2e-left}{Delayed legacy marks}%
32 <latexrelease>
33 <latexrelease>\EndIncludeInRelease
34 <*2ekernel>

```

```

```

*(End of definition for trace\_stack\_levels.)*

The default values of the picture and \fbox parameters:

```

149 \unitlength = 1pt
150 \fboxsep = 3pt
151 \fboxrule = .4pt

```

The saved value of T<sub>E</sub>X's \maxdepth:

```

152 \@maxdepth = \maxdepth

```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble. \@colroom and \@colht also initialized because \vsize may be set to them if a \clearpage is done before the \begin{document}

```

153 \vsize = 1000pt
154 \@colroom = \vsize
155 \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they are not set by the class.

```

156 \textheight=.5\maxdimen
157 \textwidth=\textheight
158 \ps@empty

```

### 1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only `\lccode` but also other related data. The `\lccode` part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide `\Umathcode`.

```
159 \ifnum 0%

222 <latexrelease>\EndIncludeInRelease
223 <*2ekernel>

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
224 \lccode'\- ='\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
225 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```

226 \def\reserved@a#1#2{%
227 \@tempcnta#1\relax
228 \@tempcntb#2\relax
229 \reserved@b
230 }
231 \def\reserved@b{%
232 \ifnum\@tempcnta>\@tempcntb\else
233 \reserved@c\@tempcnta
234 \advance\@tempcnta\@ne
235 \expandafter\reserved@b
236 \fi
237 }

```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

```

238 \def\reserved@c#1{%
239 \count@=#1\advance\count@ by -"20
240 \uccode#1=\count@
241 \lccode#1=#1
242 }

```

```

243 \reserved@a{'\a}{'\z}
244 \reserved@a{"A0}{"BC}
245 \reserved@a{"E0}{"FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

246 \def\reserved@c#1{%
247 \count@=#1\advance\count@ by "20
248 \uccode#1=#1
249 \lccode#1=\count@
250 \sfcode#1=999
251 }
252 \reserved@a{'\A}{'\Z}
253 \reserved@a{"80}{"9C}
254 \reserved@a{"C0}{"DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

255 \uccode'\^^Y=' \I % dotless i
256 \lccode'\^^Y=' \^^Y % dotless i
257 \uccode'\^^Z=' \J % dotless j, ae in OT1
258 \lccode'\^^Z=' \^^Z % dotless j, ae in OT1
259 \lccode'\^^9d=' \i % dotted I
260 \uccode'\^^9d=' \^^9d % dotted I
261 \lccode'\^^9e=' \^^9e % d-bar
262 \uccode'\^^9e=' \^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

263 \lccode'\^^[=' \^^[% oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```

264 \lccode'\- =' \- % default hyphen char
265 \lccode 127=127 % alternate hyphen char
266 \lccode 23 =23 % textcompwordmark in T1

```

End of the conditional to select either Unicode or T1 encoding defaults.

```

267 \fi

```

At this stage, we can install any last-minute `expl3` set-up.

```

268 \@expl@finalise@setup@@
269 \def\@expl@finalise@setup@@{}

```

This is as good a place as any to active a few XeTeX-specific settings

```

270 \ifx\XeTeXuseglyphmetrics\@undefined
271 \else
272 \XeTeXuseglyphmetrics=1 %
273 \XeTeXdashbreakstate=1 %
274 \fi

```

## 1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```

275 \InputIfFileExists{hyphen.cfg}

## 1.6 Input encoding

Starting with the 2018 L<sup>A</sup>T<sub>E</sub>X release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, enctex or mltx.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>

```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```
348 <latexrelease>\IncludeInRelease{2018/04/01}%
349 <latexrelease> {UTFviii@invalid}{UTF-8 default}%

Skip this section in Unicode TeX, or if MLTeX and EncTeX are enabled.

528 \reserved@c{‘\’}
529 \reserved@c{‘\|}

```

Set the ‘letter’ catcodes.

```

530 \def\reserved@c#1{\catcode#1=11\relax}
531 \reserved@a{‘\A}{‘\Z}
532 \reserved@a{‘\a}{‘\z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* `tab` (`^^I`), `nl` (`^^J`), `ff` (`^^L`) and `cr` (`^^M`).

## 1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeT<sub>E</sub>X and LuaT<sub>E</sub>X) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```
533 \ifnum 0%
534 \ifx\Umathcode\@undefined\else 1\fi
535 \ifx\XeTeXmathcode\@undefined\else 1\fi
536 >\z@
537 \else
538 \def\reserved@c#1{%
539 \count@=#1\advance\count@ by -"20
540 \uccode#1=\count@
541 \lccode#1=#1
542 }
543 \reserved@a{'\a}'{\z}
544 \reserved@a{"A0}'{"BC}
545 \reserved@a{"E0}'{"FF}
```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```
546 \def\reserved@c#1{%
547 \count@=#1\advance\count@ by "20
548 \uccode#1=#1
549 \lccode#1=\count@
550 \sfcode#1=999
551 }
552 \reserved@a{'\A}'{\Z}
553 \reserved@a{"80}'{"9C}
554 \reserved@a{"C0}'{"DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```
555 \uccode'\^^Y=' \I % dotless i
556 \lccode'\^^Y=' \^^Y % dotless i
557 \uccode'\^^Z=' \J % dotless j, ae in OT1
558 \lccode'\^^Z=' \^^Z % dotless j, ae in OT1
559 \lccode'\^^9d=' \i % dotted I
560 \uccode'\^^9d=' \^^9d % dotted I
561 \lccode'\^^9e=' \^^9e % d-bar
562 \uccode'\^^9e=' \^^d0 % d-bar
```

Finally here is one that helps hyphenation in the OT1 encoding.

```
563 \lccode'\^^[=' \^^[% oe in OT1
564 \fi % End of reset block for 8-bit engines
```

`\BCPdata` A stub for use by babel, polyglossia, etc.

```
565 \ExplSyntaxOn
566 \newcommand*\BCPdata[1]{
567 \str_case:nn {#1}
568 {
569 { language } { en }

```

```

570 { region } { US }
571 { script } { Latn }
572 { tag } { en-US }
573 }
574 }
575 \ExplSyntaxOff

```

(End of definition for \BCPdata.)

\MakeUppercase And whilst we're doing things with uc/lc tables, here are two commands to upper- and  
\MakeLowercase lower-case a string.

\MakeTitlecase Wrappers around the L3 case changing functions. \protected to make them mostly  
\NoCaseChange safe as replacements for uppercase and \lowercase.

\AddToNoCaseChangeList In

\CaseSwitch

```

\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}

```

\DeclareCaseChangeEquivalent

\DeclareLowercaseMapping

\DeclareTitlecaseMapping

\DeclareUppercaseMapping

\@uclclist

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```

\mark{\MakeUppercase Table of Contents}
{\MakeUppercase Table of Contents}

```

In order to get round this, we redefine \MakeUppercase and \MakeLowercase to grab their argument and brace it.

Earlier versions needed to process \@uclclist in an \edef to handle legacy input encodings, but recent (2022) expl3 versions handle non-UTF8 text natively so we simply call the \text\_...case:n functions.

```

576 \ExplSyntaxOn
577 \keys_define:nn { __kernel }
578 {
579 lang .str_set:N = \reserved@a ,
580 locale .str_set:N = \reserved@a
581 }
582 \cs_new_protected:Npn \@@text@case@aux #1#2#3
583 {
584 \cs_set_nopar:Npn \reserved@a { }
585 \tl_if_blank:nTF {#2}
586 {
587 \str_set:Nx \reserved@a
588 { \BCPdata { casing } }
589 \str_if_empty:NT \reserved@a
590 {
591 \str_set:Nx \reserved@a
592 { \BCPdata { language } }
593 }
594 }
595 { \keys_set:nn { __kernel } {#2} }
596 \use:c { text_ #1 case:Vn } \reserved@a {#3}
597 }

```

The odd use of *three* spaces here is needed as `ltxcmd` uses the name with one and two spaces to give a ‘friendly’ error message for a runaway argument: that means we can’t use it here.

```

598 \exp_args_generate:n { cnx }
599 \cs_set_protected:Npn \reserved@a #1
600 {
601 \cs_generate_variant:cn { text_ \str_lowercase:n {#1} case:nn } { V }
602 \ExpandArgs { cnx } \NewExpandableDocumentCommand
603 { Make#1case }
604 { 0{ } +m }
605 { \exp_not:c { Make#1case \c_space_tl \c_space_tl \c_space_tl } [####1] {####2} }
606 }
607 \reserved@a { Upper }
608 \reserved@a { Lower }
609 \reserved@a { Title }

```

Currently, `babel` uses the equivalence of `\oe` and `\OE` to force casing of some material, most notably in `\today`. To enable that to work, we have to set those commands equal even though the current case changing code does not work using this approach.

```

610 \cs_new_protected:cpn { MakeLowercase \c_space_tl \c_space_tl \c_space_tl } [#1] #2
611 {{
612 \let \OE \oe
613 \@text@case@aux { lower } {#1} {#2}
614 }}
615 \cs_new_protected:cpn { MakeUppercase \c_space_tl \c_space_tl \c_space_tl } [#1] #2
616 {{
617 \let \oe \OE
618 \@text@case@aux { upper } {#1} {#2}
619 }}
620 \cs_new_protected:cpn { MakeTitlecase \c_space_tl \c_space_tl \c_space_tl } [#1] #2
621 {{
622 \let \oe \OE
623 \@text@case@aux { title } {#1} {#2}
624 }}

```

`\NoCaseChange` protects its argument from the case change functions.

`\AddToNoCaseChangeList` Allows new commands to protect their arguments, eg `\AddToNoCaseChangeList{\eqref}` would protect the argument of `\eqref` in the same way as the argument of `\ref`.

```

625 \cs_new_protected_nopar:Npn\AddToNoCaseChangeList
626 {\tl_put_right:Nn \l_text_case_exclude_arg_tl}
627 \AddToNoCaseChangeList{ \NoCaseChange }
628 \cs_new_protected:Npn \NoCaseChange #1 {#1}
629 \cs_new_eq:NN \CaseSwitch \text_case_switch:nnnn
630 \cs_new_eq:NN \DeclareCaseChangeEquivalent
631 \text_declare_case_equivalent:Nn
632 \NewDocumentCommand \DeclareLowercaseMapping { o m m }
633 {
634 \IfNoValueTF {#1}
635 { \text_declare_lowercase_mapping:nn }
636 { \text_declare_lowercase_mapping:nnn {#1} }
637 {#2} {#3}
638 }
639 \NewDocumentCommand \DeclareTitlecaseMapping { o m m }

```

```

640 {
641 \IfNoValueTF {#1}
642 { \text_declare_titlecase_mapping:nn }
643 { \text_declare_titlecase_mapping:nnn {#1} }
644 {#2} {#3}
645 }
646 \NewDocumentCommand \DeclareUppercaseMapping { o m m }
647 {
648 \IfNoValueTF {#1}
649 { \text_declare_uppercase_mapping:nn }
650 { \text_declare_uppercase_mapping:nnn {#1} }
651 {#2} {#3}
652 }
653 \ExplSyntaxOff

654 \def\@uclclist{\oe\OE\o\O\ae\AE
655 \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\ij\IJ\th\TH}

```

(End of definition for `\MakeUppercase` and others.)

## 1.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```

656 %\IfFileExists{ltpatch.ltx}
657 % {\typeout{=====^^J%
658 % Applying patch file ltpatch.ltx^^J%
659 % =====}}
660 % \def\fmtversion@topatch{unknown}
661 % \input{ltpatch.ltx}
662 % \ifx\fmtversion\fmtversion@topatch
663 % \ifx\patch@level\@undefined
664 % \typeout{^^J^^J^^J%
665 % !!!^^J%
666 % !! Patch file 'ltpatch.ltx' not suitable for this^^J%
667 % !! version of LaTeX.^^J^^J%
668 % !! Please check if initex found an old patch file:^^J%
669 % !! --- if so, rename it or delete it, and redo the^^J%
670 % !! initex run.^^J%
671 % !!!^^J}%
672 % \batchmode \@@end
673 % \else

```

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

```

674 % \def\fmtversion@topatch{0}%
675 % \ifx\fmtversion@topatch\patch@level\else
676 % \def\reserved@a\typeout##1##2\reserved@a{%
677 % \typeout{##1 patch level \patch@level}##2}
678 % \everyjob\expandafter\expandafter\expandafter{%
679 % \expandafter\reserved@a\the\everyjob\reserved@a}
680 % \let\reserved@a\relax
681 % \the\everyjob
682 % \fi

```

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any L<sup>A</sup>T<sub>E</sub>X command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
713 \let\@filelist\@gobble
714 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

*(End of definition for \@filelist and \@addtofilelist.)*

## 1.11 Preparation for supporting PDF in backends

At the current point in time, basic support for PDF in backends is not part of L<sup>A</sup>T<sub>E</sub>X core; it is provided by external packages. At some time in the future that work will be placed into the kernel but for now it is separate and has to be explicitly loaded in the document.

In that code there is a command `\IfPDFManagementActiveTF` which can be used by packages in order to execute different code depending on the whether this basic backend support is loaded.

To make this also work properly when this external package is not loaded at all, we here add this command already in the kernel (with a trivial definition); thus any package can query this loading state in all circumstances. Once this basic PDF backend support gets moved to the kernel, this definition will vanish again from here or, rather, it will be replaced by a real test.

`\IfPDFManagementActiveTF` So long as the code for the basic backend support for PDF is not loaded, the test that is implicit here will always return the false branch. Once this code is loaded, this definition will get replaced by a real test (as it is then possible that the management code is either activated or not activated).

```
715 \let \IfPDFManagementActiveTF \@secondoftwo
```

*(End of definition for \IfPDFManagementActiveTF.)*

## 1.12 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

## 1.13 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```
716 \@input{latex2e-first-aid-for-external-files.ltx}
```

## 1.14 Dumping the format

Finally we make `@` into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```
717 \makeatother
718 \errorstopmode
719 \dump
720 </2kernel>
```

- Removed optional argument of  
`\item` . . . . . 732
- `center`: Removed optional argument  
of `\item` . . . . . 729
- `flushleft`: Removed optional  
argument of `\item` . . . . . 730
- `flushright`: Removed optional  
argument of `\item` . . . . . 731
- 1993-12-13 ltoutenc.dtx v1.2b  
General: Corrected file name in driver  
code. . . . . 422
- 1993-12-13 lttab.dtx latex2e  
`\tabbing`: Removed optional argument  
of `\item` . . . . . 797
- 1993-12-14 ltoutput.dtx v1.0i  
General: Section added to declare all  
parameters . . . . . 1109
- 1993-12-15 ltboxes.dtx v0.1d  
`\iminipage`: Changed default from  
‘c’ to ‘s’ . . . . . 783
- `\iparbox`: Changed default from ‘c’  
to ‘s’ . . . . . 780
- `\minipage`: Changed default from ‘c’  
to ‘s’ . . . . . 783
- extra space removed. . . . . 783
- `\parbox`: Changed default from ‘c’ to  
‘s’ . . . . . 780
- 1993-12-15 ltclass.dtx v0.2p  
General: Removed extra ‘s from  
`\@warnings` . . . . . 931
- 1993-12-16 ltlogos.dtx LaTeX2e  
`\LaTeXe`: Extended logo by DPC . . . 397
- 1993-12-16 ltmath.dtx v0.9i  
`\@eqnocr`: use `\refstepcounter`  
instead of shortcut . . . . . 750
- General: use `\refstepcounter` instead  
of shortcut . . . . . 749
- 1993-12-16 ltmiscen.dtx v0.9i  
General: `\literal` added . . . . . 738
- 1993-12-16 ltpage.dtx LaTeX2e  
`\mark`: Init `\mark` at begin document 925
- 1993-12-16 ltspace.dtx LaTeX2e  
`\@bsphack`: Corrected optimisation . . 384
- 1993-12-16 lttab.dtx latex2e  
`\@xhline`: Measure from middle of  
vertical rules . . . . . 812
- 1993-12-17 ltclass.dtx v0.2q  
`\@documentclasshook`: Macro added 931
- `\@fileswithoptions`: Add  
`\@compatibility` hook . . . . . 952
- `\documentstyle`: Match Alan’s new  
code. . . . . 948
- 1993-12-17 ltoutenc.dtx 1.3  
General: Added this section . . . . . 426
- Removed all the hackery for use in  
`\DeclareFontEncoding`, and redid  
everything using  
`\DeclareTextFoo`. . . . . 438, 440
- Removed the catcode hackery, since  
the file is only read as a package in  
the preamble, and removed all the  
messages on the screen, which just  
confuse users. Replaced them by  
the appropriate `\ProvidesPackage`  
commands. Added XXXenc. . . . 425
- 1993-12-17 ltoutenc.dtx v1.3  
General: Added  
`\EncodingSpecificAccent`,  
`\EncodingSpecificAccentedLetter`  
and `\EncodingSpecificCommand`. 422
- Made Rokicki’s encoding a proper  
encoding scheme rather than a  
variant of OT1. . . . . 422
- 1993-12-17 ltoutput.dtx v1.0j  
`\@opcol`: Hook removed . . . . . 1061
- `\@specialoutput`: Page room test  
added . . . . . 1056
- `\@topnewpage`: check for vsize too  
small added . . . . . 1053
- Page room test added . . . . . 1055
- `\@writersetup`: —and then removed 1065
- `\fl@tracemessage`: tracefloatvals  
made a document command . . . 1097
- 1993-12-17 ltpage.dtx LaTeX2e  
`\mark`: Removed init `\mark` at begin  
document, since it doesn’t work. 925
- `\rightmark`: Stopgap solution to mark  
`\leftmark` and `\rightmark` work  
without initializing mark until the  
problem is solved. . . . . 925
- 1993-12-18 ltoutenc.dtx 1.3b  
General: Fixed typos with  
`\ProvidesPackage` lines. Added  
the `\NeedsTeXFormat` line. Added  
the last argument to  
`\DeclareEncoding`. Moved the use  
of the encodings to after their  
declaration. . . . . 425
- Replaced the missing last argument  
to `\DeclareFontEncoding`. 438, 440
- 1993-12-18 ltoutenc.dtx 1.3c  
General: Rewrote for the new syntax  
of `\EncodingSpecific`. . . . 438, 440
- Split `\EncodingSpecificAccent` up  
into `\EncodingSpecific` and  
`\DeclareAccent`. . . . . 426
- 1993-12-18 ltoutenc.dtx v1.3a  
General: Replaced OT3 by XXX . . . 422

- Remove `\@acci` and friends again . 32
- Remove unnecessary def for `\item` 31
- `\loop`: Use Kabelschacht method . . . 29
- `\m@th`: Remove unnecessary space . . . 31
- 1994-05-16 ltspace.dtx v1.1a
  - General: (ASAJ) Split from ltinit.dtx. 377
- 1994-05-17 ltclass.dtx v1.0e
  - `\@use@option`: Execute option after removing from list, not before . . 947
- 1994-05-17 ltdefs.dtx 1.1b
  - General: (ASAJ) Added the `\@protect@...` commands. . . . . 90
- 1994-05-17 ltdefs.dtx v1.1b
  - General: (ASAJ) Added definitions for `protect`. . . . . 80
  - (ASAJ) Removed warnings and logging to lterror.dtx. . . . . 80
  - Added the discussion of protected commands, defined the values that `\protect` should have. . . . . 90
- 1994-05-17 ltdefs.dtx v1.1c
  - General: (ASAJ) Redid definitions for `protect`. . . . . 80
- 1994-05-17 lterror.dtx v1.1b
  - General: (ASAJ) Moved error stuff from ltdefs.dtx. . . . . 345
- 1994-05-17 ltfssini.dtx v2.1n
  - `\copyright`: Really add extra braces 613
  - `\nfss@text`: Added braces to allow use in subscripts . . . . . 613
- 1994-05-17 ltmath.dtx v1.0i
  - General: Replaced `\let` by `\gdef`, for indirect definition. . . . . 746
- 1994-05-17 ltoutenc.dtx v1.5j
  - General: Added braces to `\pounds` so it works as a subscript. . . . . 422
- 1994-05-18 ltdefs.dtx 1.1c
  - General: (ASAJ) Renamed the commands, and removed one which is no longer needed. . . . . 90
- 1994-05-18 ltdefs.dtx v1.1c
  - General: Redid the discussion and definitions, in line with the proposed new setting of `\protect` in the output routine. . . . . 90
- 1994-05-18 ltfinal.dtx v0.1j
  - General: Corrected the lccode for d-bar. . . . . 1123
- 1994-05-18 ltlogos.dtx v1.1b
  - General: (ASAJ) Added the  $\TeX$  logo. . . . . 397
  - (ASAJ) Made the  $\LaTeX 2\epsilon$  logo use the text font ‘2’ rather than the math font ‘2’. . . . . 397
- 1994-05-18 ltoutenc.dtx v1.5k
  - General: Made dotted-i produce ‘i’. . 422
  - Removed braces from `\pounds` and `\dollar`. . . . . 422
  - Replaced `\defaultencoding` with `\encodingdefault`. . . . . 422
- 1994-05-19 ltbibl.dtx v1.1a
  - General: Initial version of ltbibl.dtx, split from ltidxbib.dtx . . . . . 890
- 1994-05-19 ltcounts.dtx v1.1a
  - General: Extracted file from ltcntlen. 468
- 1994-05-19 ltdefs.dtx v1.1d
  - General: (RmS) Added definitions for `\@namedef` and `\@nameuse` again. . 80
- 1994-05-19 ltfinal.dtx v0.1k
  - General: Removed `\makeat...` . . . 1123
- 1994-05-19 ltidxglo.dtx v1.1a
  - General: Initial version of ltidxglo.dtx, split from ltidxbib.dtx . . . . . 887
- 1994-05-19 ltlength.dtx v1.1a
  - General: Extract file ltlength from ltcntlen. . . . . 477
- 1994-05-19 ltpageno.dtx v1.1a
  - General: Extract file ltpageno from ltcntlen. . . . . 693
- 1994-05-19 ltplain.dtx v0.1k ltfinal
  - `\showoutput`: used `\maxdimen` not 99999 . . . . . 33
  - `\showoverfull`: used `\@one` not 1 . . . . 33
- 1994-05-19 ltxref.dtx v1.1a
  - General: Extract file ltxref from ltcntlen. . . . . 694
- 1994-05-20 ltdefs.dtx v1.1e
  - General: Changed command name from `\@checkcommand` to `\CheckCommand`. . . . . 80
  - `\CheckCommand`: Changed name from `\@checkcommand` to `\CheckCommand`. . . . . 88
- 1994-05-20 lterror.dtx v1.1c
  - General: (ASAJ) Added `\@latex@info@no@line`. . . . . 345
  - (ASAJ) Added missing full stops. 345
  - (ASAJ) Fixed a bug with `\@inmatherr`. . . . . 345
- 1994-05-20 ltfinal.dtx v0.1l
  - General: Use new font warning commands . . . . . 1130
- 1994-05-20 ltfloat.dtx v1.0h
  - `\@endfloatbox`: Restore outer value of `@nobreak` switch. . . . . 873
  - `\outer@nobreak`: Macro added: default is to do nothing. . . . . 873

| Add star-forms for all commands . 80        | and                                      |
| $\renew@environment$ : reset end            | $\ProvideTextCommandDefault$ . . . 422   |
| command . . . . . 87                        | Added the $\Provide$ commands,           |
| 1994-10-18 ltfiles.dtx v1.0i                | and the default definitions. . . . 426   |
| $\listfiles$ : code moved here from         | Added the defaults. . . . . 434          |
| ltclass . . . . . 419                       | Added the files OTlenc.def,              |
| 1994-10-18 ltoutenc.dtx v1.5l               | Tlenc.def and OMSenc.def. . . . . 434    |
| General: Added new definitions of           | Added the OMS encoding. . . . . 446      |
| $\patterns$ and $\hyphenation$ . . . 434    | 1994-10-27 ltoutenc.dtx 1.6b             |
| 1994-10-18 ltoutenc.dtx v1.5m               | General: Added $\textasciicircum$        |
| General: Added new definitions of           | $\textasciitilde$ $\textbackslash$       |
| $\patterns$ and $\hyphenation$ . . . 422    | $\textbar$ $\textbraceleft$              |
| 1994-10-18 ltsect.dtx v1.0g                 | $\textbraceright$                        |
| $\@dottedtocline$ : Added                   | $\textcompwordmark$ $\textemdash$        |
| $\normalcolor$ for page number . 862        | $\textendash$ $\textexclamdown$          |
| General: Added $\normalcolor$ . . . . 851   | $\textgreater$ $\textthyphenchar$        |
| 1994-10-19 ltffsbas.dtx v2.1t               | $\textthyphen$ $\textless$               |
| $\DeclareFontEncoding$ : Add missing        | $\textquestiondown$                      |
| $\relax$ . . . . . 483                      | $\textquotedblleft$                      |
| 1994-10-23 ltfsstrc.dtx v23.k               | $\textquotedblright$                     |
| $\every@math@size$ : Renamed to             | $\textquotedbl$ $\textquoteleft$         |
| $\every@math@size$ . . . . . 537            | $\textquoteright$                        |
| 1994-10-23 ltmath.dtx v1.0l                 | $\textunderscore$                        |
| $\@eqnnum$ : Added $\normalcolor$ since     | $\textvisiblespace$ . . . . . 440        |
| $\eqno$ introduces a subgroup of the        | Added: $\textemdash$ $\textendash$       |
| displayed math group . . . . . 748          | $\textexclamdown$                        |
| $\ensuremath$ : Remove extra braces:        | $\textthyphenchar$ $\textthyphen$        |
| but see p 168 of Leslie's book . . 751      | $\textquestiondown$                      |
| 1994-10-24 ltboxes.dtx v1.0k                | $\textquotedblleft$                      |
| $\fbox$ : Inner braces added (to fix        | $\textquotedblright$                     |
| latex/1061) . . . . . 778                   | $\textquoteleft$                         |
|                                             | $\textquoteright$ . . . . . 438          |

- 1994-10-27 ltoutenc.dtx v1.5d  
 General: Rewrote  
 $\backslash\text{DeclareTextSymbol}$  to define its argument to use the current encoding by default, to fit with  
 $\backslash\text{DeclareTextCommand}$ . . . . . 426
- 1994-10-27 ltoutenc.dtx v1.6b  
 General: Added  $\backslash\text{textbackslash}$ . . . 446  
 Added more defaults for OT1. . . 434  
 Removed the enc.def files . . . . . 422  
 Removed the files OT1enc.def, T1enc.def and OMSenc.def. . . . . 434  
 Renamed  $\backslash\text{textlbrace}$  to  $\backslash\text{textbraceleft}$  and  $\backslash\text{textright}$  to  $\backslash\text{textbraceright}$ . . . . . 446
- 1994-10-29 ltmath.dtx 1.0m  
 General: ASAJ: Added  
 $\backslash\text{DeclareMathOperator}$ . . . . . 739  
 ASAJ: Tidied up documentation. 747
- 1994-10-29 ltmath.dtx v1.0m  
 General: ASAJ: Added  
 $\backslash\text{mathellipsis}$ ,  $\backslash\text{mathdollar}$  and  $\backslash\text{mathsterling}$ . . . . . 746  
 ASAJ: Removed  $\backslash\text{dag}$ ,  $\backslash\text{ddag}$ . . . . 746  
 ASAJ: Renamed  $\backslash\text{S}$  and  $\backslash\text{P}$  to  $\backslash\text{mathsection}$  and  $\backslash\text{mathparagraph}$  and made them  $\backslash\text{mathchardefs}$ . . . . . 746
- 1994-10-29 ltoutenc.dtx v1.6c  
 General: Added commands like  $\backslash\text{dots}$  for use in text and math. . . . . 434  
 Renamed  $\backslash\text{P}$ ,  $\backslash\text{S}$ ,  $\backslash\text{dag}$  and  $\backslash\text{ddag}$  to  $\backslash\text{textparagraph}$ ,  $\backslash\text{textsection}$ ,  $\backslash\text{textdagger}$  and  $\backslash\text{textdaggerdbl}$ . . . . . 422
- 1994-10-30 ltdefs.dtx v1.2c  
 $\backslash\text{@onelevel@sanitize}$ : Macro added 109  
 General: (CAR) $\backslash\text{@onelevel@sanitize}$  added . . . . . 80
- 1994-10-30 ltdefs.dtx v1.2f  
 General: (DPC) $\backslash\text{newwrite}$ 's moved to ltfiles . . . . . 80
- 1994-10-30 ltmath.dtx v1.0n  
 General: ASAJ: Moved the new commands to ltoutenc. . . . . 746
- 1994-10-30 ltoutenc.dtx v1.6d  
 General: Added  
 $\backslash\text{DeclareTextCompositeCommand}$ . 422  
 Added  $\backslash\text{textcircled}$ . . . 422, 436, 446  
 Added  $\backslash\text{t}$ . . . . . 436  
 Added math commands. . . . . 422  
 Added OML encoding. . . . . 422, 436  
 Added the OML encoding. . . . . 447
- Made  $\backslash\text{textless}$  and  $\backslash\text{textgreater}$  come from OML. . . . . 436  
 Moved math commands here from ltmath. . . . . 438  
 Removed  $\backslash\text{textregistered}$ . . . . . 436  
 Rewrote  $\backslash\text{copyright}$  to use  $\backslash\text{textcircled}$ . . . . . 436
- 1994-10-31 fontdef.dtx v2.2d  
 General: Added OMLenc.def ... . . . 620
- 1994-10-31 fontdef.dtx v2.2e  
 General: ... and moved further down 620
- 1994-10-31 ltfloat.dtx v1.1a  
 $\backslash\text{@dblfloat}$ : Major changes since two-column and one-column cases merged . . . . . 867  
 $\backslash\text{@dblfloat}$ : Macro added . . . . . 867  
 Major changes to parameter parsing, setting of local variables, etc; two-column and one-column cases merged; space hacks moved 867  
 $\backslash\text{@endfloatbox}$ : (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 873  
 $\backslash\text{@floatboxreset}$ : Macro added . . . 871  
 $\backslash\text{@footnotetext}$ : (DPC/CAR) Move colour setting to output routine . 883  
 $\backslash\text{@savemarbox}$ : (DPC/CAR) Extra box added for colour . . . . . 877  
 $\backslash\text{@setfps}$ : Macro added . . . . . 868  
 $\backslash\text{@xdblfloat}$ : Macros removed:  
 $\backslash\text{@dbflt}$ ,  $\backslash\text{@xdblfloat}$  . . . . . 873  
 $\backslash\text{@xfloat}$ : (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 869  
 Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged . . . . . 868  
 Reset hook added . . . . . 869  
 $\backslash\text{@xympar}$ : (DPC/CAR) Extra box added since needed for floats . . . 878  
 $\backslash\text{fps@dbl}$ : Macro added . . . . . 868
- 1994-10-31 ltoutput.dtx v1.1a  
 $\backslash\text{@makecol}$ : (DPC/CAR) Colour resetting moved to here . . . . . 1062  
 $\backslash\text{@topnewpage}$ : (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 1054  
 (DPC/CAR) Use  
 $\backslash\text{color@begingroup}$  for colour . 1054  
 (DPC/CAR) Use  $\backslash\text{normalcolor}$  1054
- 1994-11-02 ltoutenc.dtx v1.6d  
 General: Wrapped lines longer than 70 characters. . . . . 422

- 1995-11-07 ltoutenc.dtx v1.7o  
 General: Added `\leavevmode` at start of `\c`, otherwise the output routine might be invoked within the macro. . . . . 438  
 Changed `\char32` to `\xxxii` (two tokens less). . . . . 439  
 Replaced octal number 27 by decimal number 23 to protect against the quote character being active. . . . . 439  
 Replaced some 0's by `\z@` (faster). 439
- 1995-11-10 ltoutput.dtx v1.1s  
`\@shipoutsetup`: Command removed . . . . . 1065  
`\@writsetup`: Command removed . . . . . 1065  
 In-lined . . . . . 1065
- 1995-11-14 ltclass.dtx v1.0t  
`\@unprocessedoptions`: Allow empty option . . . . . 961  
`\@loadwithoptions`: macro added . . . . . 949  
`\LoadClassWithOptions`: macro added . . . . . 949  
`\RequirePackageWithOptions`: macro added . . . . . 949
- 1995-11-17 ltfssbas.dtx v3.0m  
`\@wrong@font@char`: (DPC) Macro added. latex/1676 . . . . . 499  
`\define@newfont`: Redefine `\typeout` latex/1676 . . . . . 493  
`\wrong@fontshape`: Support `\@wrong@font@char` latex/1676 . . . . . 498
- 1995-11-17 ltoutenc.dtx v1.7p  
`\UseTextSymbol`: Support `\@wrong@font@char` latex/1676 . . . . . 431
- 1995-11-18 ltoutenc.dtx v1.7q  
`\UseTextSymbol`: Modify message slightly . . . . . 431
- 1995-11-21 fontdef.dtx v2.2n  
 General: Incorporate changed figures, as in plain.tex . . . . . 634
- 1995-11-27 ltfssbas.dtx v3.0n  
`\nfss@catcodes`: Reset hash, for definitions in fd files . . . . . 494
- 1995-11-28 ltfloat.dtx v1.1n  
 General: documentation fixes . . . . . 864
- 1995-11-28 ltfsssrc.dtx v3.0g  
 General: documentation fixes . . . . . 528
- 1995-11-28 ltoutenc.dtx v1.7r  
 General: Added math mode checks to text commands. . . . . 426  
 doc fixes . . . . . 422  
 Renamed `\@changed@x@err` to `\TextSymbolUnavailable`. . . . . 426
- 1995-11-29 ltoutenc.dtx v1.7t  
 General: Added `\textasciicircum`, `\textasciitilde`, `\textbackslash`, `\textbar`, `\textgreater` and `\textless`. . . . . 442  
 Added `\textasciicircum`, `\textasciitilde`, `\textregistered` and `\texttrademark`. . . . . 436  
 Added `\textbackslash` and `\textbar`. . . . . 435, 446  
 Added `\textless` and `\textgreater`. . . . . 436, 447
- 1995-12-01 ltoutenc.dtx v1.7u  
 General: Made `\SS` a Default, rather than having the default point to the OT1 definition. . . . . 436
- 1995-12-04 ltspace.dtx v1.2k  
`\nobreakspace`: Macro added . . . . . 393
- 1995-12-04 ltspace.dtx v1.2l  
`\@xobeysp`: braces added to definition of tilde . . . . . 393
- 1995-12-04 preload.dtx v2.4e  
 General: Ulrik Vieth. added 12pt OMS and OML preloads /1989 . . . . . 641
- 1995-12-05 ltdefs.dtx 1.2w  
`\@unexpandable@protect`: Removed `\unexpandable@noexpand` as never used. internal/1733 . . . . . 90
- 1995-12-05 ltfiles.dtx v1.1c  
`\document`: `\ignorespaces` added for latex/1933 . . . . . 402
- 1995-12-05 ltfloat.dtx v1.1n  
`\@textsuperscript`: Use `\ensuremath` for latex/1984. . . . . 882
- 1995-12-05 ltoutenc.dtx v1.7v  
`\@inmathwarn`: Changed `\TextSymbolUnavailable` text . . . . . 427
- 1995-12-06 ltfssbas.dtx v3.00  
`\nfss@catcodes`: Reset hat, for typeouts etc in fd files . . . . . 494
- 1995-12-07 ltbibl.dtx v1.1l  
`\@citex`: Restored name of `\G@refundefinedtrue` . . . . . 892
- 1995-12-07 ltfloat.dtx v1.1m  
`\@textsuperscript`: Move `\m@th` out of the `\ensuremath` for latex/1984. . . . . 882
- 1995-12-07 ltxref.dtx v1.1i  
`\@setref`: Switch for redefined restored . . . . . 696  
`\G@refundefinedtrue`: Renamed (back) from `\G@refundefined` . . . . . 695

- 1996-10-26 ltlists.dtx v1.0o  
`\endtrivlist`: Correct typo . . . . . 764
- 1996-10-27 ltoutenc.dtx v1.8c  
`\@strip@args`: Removed macro . . . 429  
 General: Added `\r A` . . . . . 439  
 Added  
`\textasteriskcentered` . . 435, 446  
 Corrected syntax descriptions . . . 423  
 Removed `\aa` and `\AA` . 435, 439, 442
- 1996-10-28 ltplain.dtx v1.1u  
 General: (CAR) More doc changes . . 14  
`\dotfill`: Removed math mode . . . . 32
- 1996-10-29 ltplain.dtx v1.1v  
`\dotfill`: Got arithmetic correct  
 (CAR) . . . . . 32
- 1996-10-29 ltspace.dtx v1.2u  
`\@gnewline`: Added macro . . . . . 383  
`\@no@lnbk`: Macro replaces `\@lnbk` and  
`\@no@lnbk` . . . . . 381  
`\:`: Corrected and rationalised code 381  
`\nolinebreak`: Reimplemented both  
 using `\@no@lnbk` . . . . . 380
- 1996-10-31 ltfinal.dtx v1.0z  
 General: Added extra `\lcode`, hoping  
 it does no harm in T1  
 (pr/1969) . . . . . 1129, 1136
- 1996-10-31 ltlists.dtx v1.0p  
`\@trivlist`: Added check for missing  
 item in outer list . . . . . 763
- 1996-10-31 ltsect.dtx v1.0y  
 General: Corrected and tidied  
 documentation; removed long  
 lines . . . . . 851
- 1996-11-03 ltplain.dtx v1.1w  
`\dotfill`: Saved tokens by using  
`\hb@xt@` . . . . . 32
- 1996-11-04 lterror.dtx v1.2m  
`\@nodocument`: Always define  
`\@nodocument` in kernel, so that it  
 can be cleared by `\document`. . . 352
- 1996-11-04 ltlists.dtx v1.0q  
`\@trivlist`: Moved check for missing  
 item: only checked when not  
 inlabel flag is false . . . . . 763
- 1996-11-05 ltfiles.dtx v1.1i  
`\nofiles`: Standard `\if@nobreak` test  
 added . . . . . 405
- 1996-11-09 ltmath.dtx v1.1c  
`\@ensuredmath`: Made long, as it was  
 before. /2104 . . . . . 751
- 1996-11-18 ltffsbas.dtx v3.0s  
`\define@newfont`: (DPC) lowercase fd  
 file names. internal/1044 . . . . . 494
- 1996-11-18 ltoutenc.dtx v1.8d  
 General: (DPC) lowercase external file  
 names. internal/1044 . . . . . 465
- 1996-11-20 fontdef.dtx v2.2p  
 General: lowercase fd and enc.def file  
 names /1044 . . . . . 618
- 1996-11-20 ltvers.dtx v1.0f  
 General: Check for old format  
 modified /2319 . . . . . 37
- 1996-11-23 ltoutenc.dtx v1.8e  
 General: Corrected description . . . . 423  
 Extended description . . . . . 424
- 1996-11-28 ltvers.dtx v1.0g  
 General: Check for old format  
 modified /2319 . . . . . 37
- 1996-12-06 ltdirchk.dtx v1.0u  
`\IfFileExists`: \*\*\* removed from  
 various messages for GNU Make.  
 internal/2338 . . . . . 10
- 1996-12-06 ltfloat.dtx v1.1r  
`\@caption`: Call `\@setminpage` if  
 needed. latex/2318 . . . . . 867
- 1996-12-06 ltffssini.dtx v3.0h  
 General: (DPC) Remove \*\*\* from  
 messages internal/2338 . . . . . 616
- 1996-12-17 ltdefs.dtx v1.0w  
`\g@addto@macro`: Use `\begingroup` to  
 save making a mathord . . . . . 112
- 1996-12-20 ltsect.dtx v1.0z  
`\@dottedtocline`: Added `\nobreak` for  
 latex/2343 . . . . . 862
- 1997-01-08 fontdef.dtx v2.2q  
 General: Use `\DeclareMathDelimiter`  
 to set delimiter codes . . . . . 627  
`\mathparagraph`: Define using  
`\DeclareMathSymbol` . . . . . 636
- 1997-01-08 ltfiles.dtx v1.1j  
`\@include`: reset `\deadcycles`  
 latex/2365 . . . . . 409
- 1997-01-08 ltmath.dtx v1.1d  
`\root`: (DPC) Remove spurious space  
 tokens from plain T<sub>E</sub>X definition  
 /2359 . . . . . 741
- 1997-02-05 ltdefs.dtx v1.0x  
`\g@addto@macro`: missing percent  
 /2402 . . . . . 112
- 1997-02-21 ltlists.dtx v1.0r  
`\@item`: `\ifvoid` check added for  
`\noindent`. latex/2414 . . . . . 767
- 1997-03-21 ltcounts.dtx v1.1e  
`\fnsymbol`: Use `\mathsection` and  
`\mathparagraph`. latex/2445 . . . 473

`\@currentcounter` (gh/687) . . . 753
- 2021-10-15 ltfssdcl.dtx v3.0y  
`\DeclareMathVersion:` Initialize variable for freezing math version (gh/676) . . . . . 569
- 2021-10-15 ltluatex.dtx v1.1v  
General: provide `_charproc_data` added . . . . . 63
- 2021-10-16 ltoutenc.dtx v2.0x  
`\add@accent:` Dont set  
`\spacefactor` in math mode gh/643 . . . . . 429
- 2021-10-19 ltpara.dtx v1.0k  
General: Remove content from  
`\tex_everypar:D` on rollback . . . 374
- 2021-10-20 ltcmdhooks.dtx v1.0f  
`\__hook_make_prefixes:w:` Correct patching by expansion+redefinition when the macro contains a parameter token (gh/697). . . . . 310
- 2021-11-17 ltluatex.dtx v1.1w  
General: `hpack_` quality is **exclusive** 63  
Never pass on **true** return values for list callbacks . . . . . 65  
`vpack_` quality is **exclusive** . . . . 63
- 2021-11-30 ltclass.dtx v1.5a  
`\@onefilewithoptions@clashchk:` Separated out from  
`\@onefilewithoptions` . . . . . 956
- 2021-11-30 ltexpl.dtx v1.3d  
`\skipeval:` Moved over from `xfp` package (gh/711) . . . . . 77
- 2021-12-02 ltcmd.dtx v1.0i  
`\__cmd_run_code::` Correct defaults for optional arguments in end-of-environment code (gh/712) 123  
`\__cmd_start_aux:ccnnnn:` Correct defaults for optional arguments in end-of-environment code (gh/712) 123
- 2021-12-07 ltexpl.dtx v1.3d  
`\skipeval:` Added `\dimeval` and `\skipeval` (gh/711) . . . . . 78
- 2021-12-11 ltdirchk.dtx v1.3a  
General: Add comment lines into `latex.ltx` to indicate temp definitions that are later overwritten (gh/725) . . . . . 2
- 2021-12-12 ltoutenc.dtx v2.0y  
General: `\DeclareUnicodeAccent` now makes the encoding argument implicit (gh/253) . . . . . 456  
Added `\DeclareUnicodeCommand` and `\DeclareUnicodeSymbol` (gh/253) . . . . . 456
- 2021-12-27 ltluatex.dtx v1.1x  
`\newprotectedluaCmd:` Macros added 51
- 2021-12-28 ltexpl.dtx v1.3d  
`\ExpandArgs:` Added document level names for `\exp_args:Nc` and the like (gh/735) . . . . . 78
- 2021-13-31 ltcmd.dtx v1.0j  
`\__cmd_show:x:` Make `\ShowCommand` stop for interaction . . . . . 151, 152
- 2022-01-06 ltexpl.dtx v1.3e  
`\ExpandArgs:` Adjust document level names for `\exp_args:Nc` and the like (gh/735) . . . . . 78
